1. GENERAL

1.1 Book 6 - Executive summary

1.1.1. Objectives

Books 2 to 5 of the Volume describe all of the functional, data, security and conformance verification process requirements for Card payments services initiated in the SEPA area.

As not all requirements and Services described in Book 2 of the Volume are offered and supported in all implementations, common subsets of Services and requirements offered by the acceptors are identified as 'payment contexts'. A payment context is defined as "a set of functional and security requirements described in the Volume applicable to ~~Cards~~ Payment Instruments and POIs in a specific 'transaction environment'".

Support of a particular payment context is optional. However, if a payment context is supported then all mandatory requirements defined in Book 6 relating to this context must be met.

~~Book 6 also provides migration paths and timelines to assist with the aim of maintaining interoperability in the migration to full Volume conformance. Another objective of Book 6 is to phase-out some implementations which create risks to SEPA for Cards implementations.~~

This document will provide:

- ~~Guidelines~~ Best practices to support the implementation of Regulatory requirements;
- General ~~Implementation Guidelines~~ best practices for implementation and options applicable to the Payment Contexts;
- Specific ~~implementation Guidelines~~ best practices for implementation and ~~o~~Options for each Payment Context;
- Use cases for contactless as well as e- and m-commerce transaction scenarios;
- ~~Timelines for all newly approved solutions to be conformant to the Volume;~~
- ~~Sunset dates for the removal of non Volume conforming functions and options.~~

~~The requirements~~ Guidance per payment context ~~are~~ is necessary because several implementations of the same service have evolved in the European markets. ~~Consequently, it has been agreed is a prerequisite~~ - that all Card Payment stakeholders ~~shall~~ harmonise on the Volume requirements. If several implementation options are ~~possible~~ available for a context, the preferred option(s) will be indicated in Book 6.

Based on the volume of transactions or on specific sector or European market needs, a number of payment contexts have been defined. Currently,

The One-off Payment Service:

- Local with:
 - Chip with Contact;
 - Chip and Mobile Contactless.
- Remote with:
 - E- and m-Commerce
 - Mail Order Telephone Order

Deferred Payment Service:

- Local with:
 - Chip with Contact;

Pre-Authorisation Service:

- Local with:
 - Chip with Contact;

~~Additional contexts and use cases will be described in future versions of this document, including (for example) ATMs.~~

The creation and maintenance of implementation specifications are out of scope of this book.

~~1.1.2. Migration Roadmap~~

~~In addition to the 3 year conformance process after publication of the Volume as described in Book 1, Book 6 may allow or require alternative timelines for the implementation of a particular function, service or option. These timelines may also be applicable to Issuers, Acquirers and Schemes.~~

~~1.1.3.1.1.2.~~ Structure of this book

Guidelines supporting the implementation of Regulatory requirements are contained in ~~chapter~~ section 2. The General best practices for implementation ~~guidelines~~ and options are defined in section ~~chapter~~ 3 and specific payment contexts ~~implementation~~ guidelines are set out in section ~~chapter~~ 4. Section ~~Chapter~~ 4 includes Volume conformant requirements and implementation options ~~with selected roadmaps for implementing the options by a given date.~~ Section ~~Chapter~~ 5 contains the description of a number of use cases to illustrate ~~mobile contactless~~ various payment transactions.

References, definitions of terms and abbreviations are provided in Book 1.

1.2 Description of changes since the last version of Book 6

~~Section providing guidance for PSD2-related requirements, such as MITs, has been integrated.~~

~~Guidelines for non-standard card acceptance have been introduced.~~

~~Guidance for Card Data Retrieval for Virtual POI from former Annex 1 has been integrated within the general implementation guidelines of section 3.~~

Integration of Instant Credit Transfers (ICT).

Integration of best practices in relation to the Directive of the European Parliament and of the Council on the approximation of the laws, regulations and administrative provisions of the Member States as regards the accessibility requirements for products and services (COM/2015/0615 final - 2015/0278 (COD)) – also known as European Accessibility Act [EAA].

Description of Selection of Payment Solution implementations and flows.

Guidelines based on ERPB recommendations for transparency for retail payment end-users.

Update of content and diagrams on integration modes for Account Data Retrieval and Stored Card Data and SRC in Virtual POI environments.

Update of best practices for implementation per payment context.

Update of existing use cases for Card Transactions and addition of use cases for ICT Transactions.

2. BEST PRACTICES FOR REGULATORY IMPLEMENTATION GUIDELINES

2.1. Introduction

During the lifetime of The Volume, several pieces of legislation impacting SEPA for Cards have been published by European regulators. The ~~ECSG~~EPSG (former ECSG), during maintenance updates to the Volume, have considered the regulations (listed below) and updated books accordingly. In addition, the guidelines contained within this section have also been produced.

The ~~ECSG~~EPSG is of the opinion that the Volume does not contain any requirements that cause concern with complying with these regulations. However, it is the responsibility of all entities implementing the Volume requirements to ensure they meet their legal obligations.

~~The remainder of this section describes implementation best practices for implementation guidelines~~ that have arisen due to the following pieces of legislation.

- Regulation (EU) 2015/751 of the European Parliament and of the Council of 29 April 2015 on interchange fees for card-based payment transactions [IFR]
- Directive (EU) 2015/2366 of the European Parliament and of the Council of 25 November 2015 on payment services in the internal market, amending Directives 2002/65/EC, 2009/110/EC and 2013/36/EU and Regulation (EU) No 1093/2010, and repealing Directive 2007/64/EC [PSD2]
 - Commission Delegated Regulation (EU) 2018/389 of 27 November 2017, supplementing [PSD2] with regard to regulatory technical standards for strong customer authentication and common and secure open standards of communication [RTS SCA/CSC]
- Regulation (EU) 2016/679 of the European Parliament and of the Council of 27 April 2016 on the protection of natural persons with regard to the processing of personal data and on the free movement of such data, and repealing Directive 95/46/EC (General Data Protection Regulation) [GDPR]
- Directive (EU) 2019/882 of the European Parliament and of the Council of 17 April 2019 on the accessibility requirements for products and services (European Accessibility Act)-(EAA)[EAA]

2.2. IFR Implementation Guidelines

2.2.1. ~~Implementation guidance on~~ Priority Selection and Choice of Application

This section describes implementation examples of the Acceptor's priority selection for their preferred ~~a~~Application and the Cardholder's Choice of Application mechanism, as described in IFR article 8.6 [IFR], for local contact, local contactless and Remote Card transactions for EEA issued co-badged Cards using:

- An overriding option during the EMV payment process

- An override option using the upfront selection screen before the EMV payment process starts
- A Choice of Application by the Cardholder during the EMV payment process

The subsequent processing is not described as is out of scope of this section.

It is the Acceptor's decision which Cardholder's Choice of Application mechanism they implement. It is also their decision which priority selection and override mechanisms they implement.

The Acceptor's implementation options are not restricted to the examples shown in this section.

Note: This is a non-exhaustive list of examples of priority selection implementation.

A summary of all examples is illustrated:

		Type Choice of Application with override		
Environment	Acceptance Technology	Choice by Cardholder without Preference	Acceptor preference with override option upfront	Acceptor's pre-selection with override option once the transaction is started
Local Physical POI 2.2.1	Chip with Contact 2.2.1.1	Example 1: Cardholder choice Text based interface (2.2.1.1.1) Example 2: Cardholder choice Graphical interface (2.2.1.1.2)	Example 3: Upfront Acceptor preferred Brand preselection with override after Card insertion (2.2.1.1.3)	Example 4: Acceptor preferred selection with override during the EMV process (2.2.1.1.4) Example 5: Acceptor preferred selection with override on the same screen using arrows during EMV process (2.2.1.1.5) Example 6: Acceptor preferred selection with override on the same screen using graphical interface during EMV process (2.2.1.1.6)
Local Physical POI 2.2.1	Chip with Contact, Chip & mobile Contactless 2.2.1.2		Example 7: Acceptor Pre-selection with override up front (2.2.1.2.1)	
Local Physical POI 2.2.1	Mobile Contactless (wallet) 2.2.1.3	Example 8: Cardholder choice prior to presenting the Mobile Device (2.2.1.3.1)	Example 9: Choice of Application with a Mobile Device supporting multiple Applications (2.2.1.3.2)	
Remote Virtual POI 2.2.2	Manual Entry by Cardholder	Example 10: Cardholder selection using brand logos (2.2.2.1)		Example 11: Acceptor's priority selection using BIN/ IIN tables with a Cardholder's override mechanism (2.2.2.2)

Figure 1: SUMMARY OF EXAMPLE IMPLEMENTATIONS OF CHOICE OF THE APPLICATION WITHIN BOOK 6

2.2.2. Local Transactions - Physical POI

2.2.2.1. Contact - Choice by Cardholder without Acceptor Preference

2.2.2.1.1. Example 1: Contact - Cardholder Choice - Text based interface

In this particular example, for a contact EMV transaction, the acceptor has not implemented a priority selection and the POI allows for Cardholder choice. The POI shall present all mutually supported co-badged Applications to enable Cardholder choice.

- Step 1:

When presented to the Cardholder, the Application name, and if available the Category of Card, should be accompanied by a number. This allows the Cardholder to choose the Application by using a key on the numeric keypad, corresponding to the number assigned to each Application mutually supported.

Select Application

1 Brand A

2 Brand B

3 Brand C

Press the number of the
Application and enter OK

Figure 2: EXAMPLE 1 (STEP 1): CONTACT - CHOICE BY CARDHOLDER WITHOUT ACCEPTOR PREFERENCE - TEXT BASED INTERFACE

- Step 2:

The Cardholder is then asked to enter their PIN and validate the transaction.

Application	Brand B
EUR	100.00
Enter PIN	****
+ OK	

Figure 3: EXAMPLE 1 (STEP 2): CONTACT - CHOICE BY CARDHOLDER WITHOUT ACCEPTOR PREFERENCE - TEXT BASED INTERFACE, INCLUDING THE SELECTED APPLICATION, TOTAL AMOUNT AND PIN ENTRY

2.2.2.1.2. Example 2: Contact - Cardholder Choice - Graphical interface

If the Acceptor has no preference over which Application they wish the Cardholder to use then they may follow EMV processing, displaying all available co-badged Applications allowing the Cardholder to choose. If all Applications are displayed, it is recommended to display the brand logos associated with the Applications to provide visual assistance to the Cardholder (see **Figure 4**).

Figure 4: EXAMPLE 2: CONTACT - CHOICE BY CARDHOLDER WITHOUT ACCEPTOR PREFERENCE - GRAPHICAL INTERFACE

After having selected the preferred application by using a key on the numeric keypad, corresponding assigned to the numberbrand logo displayed assigned to each Application, The
Cardholder is then asked to enter their PIN and validate the transaction (see step 2 of example 1).

2.2.2.1.3. Example 3: Contact - Upfront Acceptor preferred Brand preselection with override after Card insertion

- Step 1:

An Acceptor may have a preferred aApplication and may wish to indicate to Cardholders their preferred aApplication, prior to the co-badged Card being inserted (see **FIGURE 5**).

Figure 5: EXAMPLE 3 (STEP 1): CONTACT - UPFRONT ACCEPTOR PREFERRED BRAND PRESELECTION WITH OVERRIDE

- Step 2:

On insertion of the Card, however, the Cardholder still has the right to override the Acceptor choice. The method of overriding the Acceptor choice is made clear to the Cardholder (see **FIGURE 6**).

Figure 6: EXAMPLE 3 (STEP 2): CONTACT - UPFRONT ACCEPTOR PREFERRED BRAND PRESELECTION WITH OVERRIDE AFTER CARD INSERTION

If the Acceptor's preferred Aapplication is not available on the Card then the Acceptor may steer the Cardholder to one of the available Applications or may allow the Cardholder to choose using any of the methods described in these examples. Once the Cardholder has confirmed the Application to be used for that transaction, normal EMV processing resumes.

2.2.2.1.4. Example 4: Contact - Acceptor preferred selection with override during the EMV process

If using an automatic mechanism which pre-selects the Acceptor's preferred co-badged Application, all the required information is displayed to the Cardholder on the POI's first screen in the following order:

1. The pre-selected Acceptor's Application,
2. The function for the Cardholder to override the Acceptor's pre-selection,

The above should be provided, if possible, at the first Cardholder confirmation prompt, ~~which may include, if applicable;~~

- ~~• transaction amount,~~
- ~~• the request to enter the PIN entry.~~

~~FIGURE 7: EXAMPLE 4: CONTACT - ACCEPTOR PREFERRED SELECTION WITH OVERRIDE DURING THE EMV PROCESS - WITH SIGNATURE AS CVM AND WITHOUT DISPLAYING THE FINAL AMOUNT¹~~

Figure 7: EXAMPLE 4: CONTACT - ACCEPTOR PREFERRED SELECTION WITH OVERRIDE DURING THE EMV PROCESS - WITH THE TOTAL AMOUNT AND PIN ENTRY AS CVM²

¹ ~~If, in the current screen a specific button is being used to support another function, for example the yellow button for PIN entry-correction, then it is recommended to implement another button such as a 'Change Choice' button.~~

² If, in the current screen a specific button is being used to support another function, for example the yellow button for PIN entry-correction, then it is recommended to implement another button such as a 'Change Choice' button.

If the Cardholder wishes to override the Acceptor's pre-selection by pressing the indicated button on the key pad, the POI will display to the Cardholder all Card Applications mutually supported by the Card and the POI, either by listing them as with ~~with assigned numbers~~ corresponding numbers on the key pad (as in example 1), or showing the graphical brand logos associated with the Card Application with corresponding numbers on the key pad ~~for selection~~ (as in example 2).:

- The Acceptor may put their preferred Application on top of the list as priority selection.
- The Cardholder will be able to accept or override the Acceptor's choice by selecting their preferred choice of Card Application, ~~by using a key on the numeric keypad;~~ assigned to the brand logo associated with the Card Application or brand Application name displayed, to start the payment process.

2.2.2.1.5. Example 5: Contact - Acceptor preferred selection with override on the same screen using arrows during EMV process

Acceptor pre-selection with override mechanism available on the same screen.

Acceptors may wish to steer Cardholders to the Acceptor's preferred co-badged Application but give access to all the available Applications on the same screen. A method of doing this is shown in **FIGURE 8**.

Figure 8: EXAMPLE 5 (STEP 1): CONTACT - ACCEPTOR PREFERRED SELECTION WITH OVERRIDE ON THE SAME SCREEN USING ARROWS

If the Cardholder does not wish to use the Acceptor's preferred Application and uses the 'arrows' function the screen scrolls through the available brands, associated with the Card Applications available (see **FIGURE 9**). Once the Cardholder has confirmed the Application to be used for that transaction, normal EMV processing resumes.

Figure 9: EXAMPLE 5 (STEP 2): CONTACT - CARDHOLDER SELECTION AFTER OVERRIDE USING ARROWS

2.2.2.1.6. Example 6: Contact - Acceptor preferred selection with override on the same screen using graphical interface during EMV process

On presentation of the co-badged Card, the Acceptor chooses their preferred aApplication, and presents it to the Cardholder for confirmation (see **FIGURE 10**). At the same time, it is made clear to the Cardholder that other payment options are available, and how to access the other options. If the Cardholder accepts the Acceptor choice, normal EMV processing resumes.

Figure 10: EXAMPLE 6 (STEP 1): CONTACT - ACCEPTOR PREFERRED SELECTION WITH OVERRIDE ON THE SAME SCREEN USING GRAPHICAL INTERFACE

If the Cardholder selects ‘other payment options’, all available Applications are listed (see **Figure 11**). The Acceptor may present their preferred aApplication first. After having selected the preferred application by using a key on the numeric keypad, assigned to the brand logo displayed, the~~On selection of the Cardholders preferred Application~~ normal EMV processing resumes.

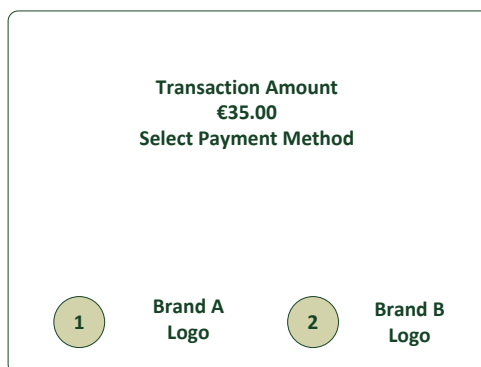

Figure 11: EXAMPLE 6 (STEP 2): CONTACT - CARDHOLDER SELECTION AFTER OVERRIDE USING GRAPHICAL INTERFACE

2.2.2.2. Contact and Contactless - Acceptor preselection with override upfront

2.2.1.2.1. Example 7: Contact and Contactless - Acceptor Pre-selection with override up front

The Cardholder may perform a selection of a co-badged Card Application using an upfront selection screen presented by the POI whereas the actual selection occurs after the Card interacts with the POI.

The selection may be performed through (but not limited to):

- A 'Corr'/yellow button with function keys
- Additional keys like Softkeys or touchpad-Keys next to the POI screen
- A virtual button on the touchscreen of the POI

When presented with the upfront selection screen, the Cardholder has two main options.

1. If they have a preference as to which Card payment Application to use:
 - a. They indicate to the POI their wish to have displayed the Card Applications available to use to pay by choosing the Corr / Yellow button, prior to the transaction being initiated (additional keys or virtual button may be provided).
 - b. After the Card has been read by the POI, either by ~~presenting or~~ inserting the Card or presenting the card or mobile device, the POI will display to the Cardholder all Card Applications mutually supported by the Card / mobile device and the POI.
 - The Acceptor may put their preferred aApplication on top of the list as priority selection either by listing them with corresponding numbers on the key pad (as in example 1), or showing the graphical brand logos associated with the Application with corresponding numbers on the key pad (as in example 2).

- The Cardholder will be able to accept or override the Acceptor's choice by selecting their preferred choice of Card Application to start the payment process.³

- If the card was presented in a contactless mode An additional tap for the Choice of Application may be required after the Cardholder's preferred choice was selecteds , though the process is not described in the current release of the Volume.⁴

2. If they have no preference on which Card payment Application is used:

- a. They ~~present or~~ insert the Card or present the card or mobile device.
- b. After the Card or mobile device has been read by the POI, the Acceptor's preferred aApplication is automatically selected.

As this would be implemented for Chip contact and contactless Card payments upfront, after the above selection process is passed through, a standard EMV payment process will apply.

The Cardholder instructions regarding the upfront selection option are indicated on the POI display or through other means like a sticker when the POI display is limited (e.g., an unattended POI with only a two line display).

An example of the POI message using the yellow function keys button providing a Choice of Application to the Cardholder with an upfront selection screen is displayed in **FIGURE 12**.

Figure 12: EXAMPLE 7: CONTACT & CONTACTLESS - ACCEPTOR PRE-SELECTION WITH OVERRIDE UP FRONT

³ Where the Cardholder is using a mobile device containing multiple Card applications, the cardholder's preferred choice of card application is selected on the cardholder's mobile device and not on the POI. Only then will the mobile device be presented again to the POI to confirm the preferred choice of application (next step).

⁴ Where the Cardholder is using a mobile device containing multiple Card applications, the cardholder's preferred choice of card application is selected on the cardholder's mobile device and not on the POI. before the second tap is made. Only then will the mobile device be presented again to the POI to confirm the preferred choice of application.

If the Cardholder wishes to choose their preferred method of payment and selects the 'change choice' button, then the Cardholder may:

- Insert the Card in the POI

All Card Applications mutually supported by the Card and the POI are presented to the Cardholder for them to select. The Acceptor's preferred Application may be the first Application in the list presented and/or may be highlighted.

After selection by the Cardholder, standard EMV payment process applies.

- Present the Card to the POI

All Card Applications mutually supported by the Card and the POI are presented to the Cardholder for them to select. The Acceptor's preferred Application may be the first Application in the list presented and/or may be highlighted.

An additional tap for the Choice of Application may be required, though the process is not described in the current release of the Volume.

After selection by the Cardholder, standard EMV payment process applies.

If the Cardholder does not wish to choose and therefore does not press the 'change choice' button, then the Cardholder may:

- Insert the Card in the POI

The Acceptor preferred Application is selected. The Cardholder may be asked to enter the PIN and confirm (PIN verification).

Standard EMV contact payment applies.

- Present the Card or Mobile Device to the POI

The Cardholder wants to "tap & go" (tap a Card, a mobile...). The Acceptor preferred Application is selected. The Cardholder may be asked to enter the PIN and confirm if the amount is above the CVM limit (online PIN verification).

Standard EMV contactless payment applies.

2.2.2.3. Local Mobile Contactless (wallet)

2.2.2.3.1. Example 8: Mobile Contactless Cardholder choice prior to presenting the Mobile Device

To simplify the transaction process whilst using a mobile device, the Cardholder may choose their preferred co-badged Application prior to presenting their device for payment (see Figure 14), note that a Cardholder may have several wallets on the same payment device. Should the Cardholder choose their preferred Application in this way, the Acceptor's POI will only be presented with a single Application and may automatically select it.

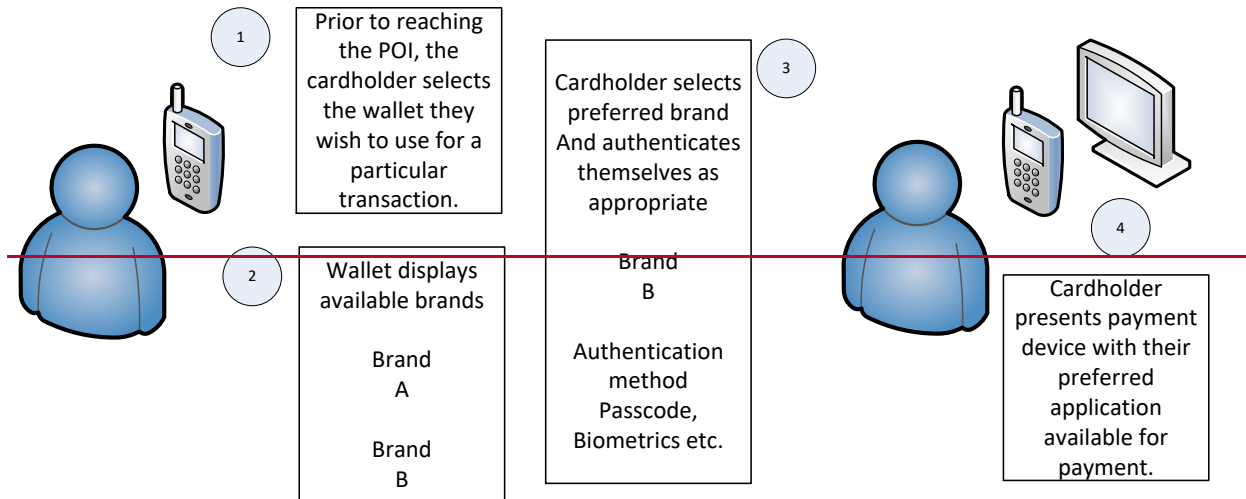

Figure 14: ~~EXAMPLE 8: MOBILE CONTACTLESS – CARDHOLDER CHOICE PRIOR TO PRESENTING THE MOBILE DEVICE~~

~~2.2.2.3.2. Example 9: Mobile Contactless – Choice of Application with a Mobile Device supporting multiple Applications~~

~~A mobile device may return several co-badged Applications in the PPSE in which case, Choice of Application by the Acceptor and Cardholder is performed on the POI. The method of doing so is determined by the routine that the Acceptor has implemented, which may be one of the contactless implementation examples described above.~~

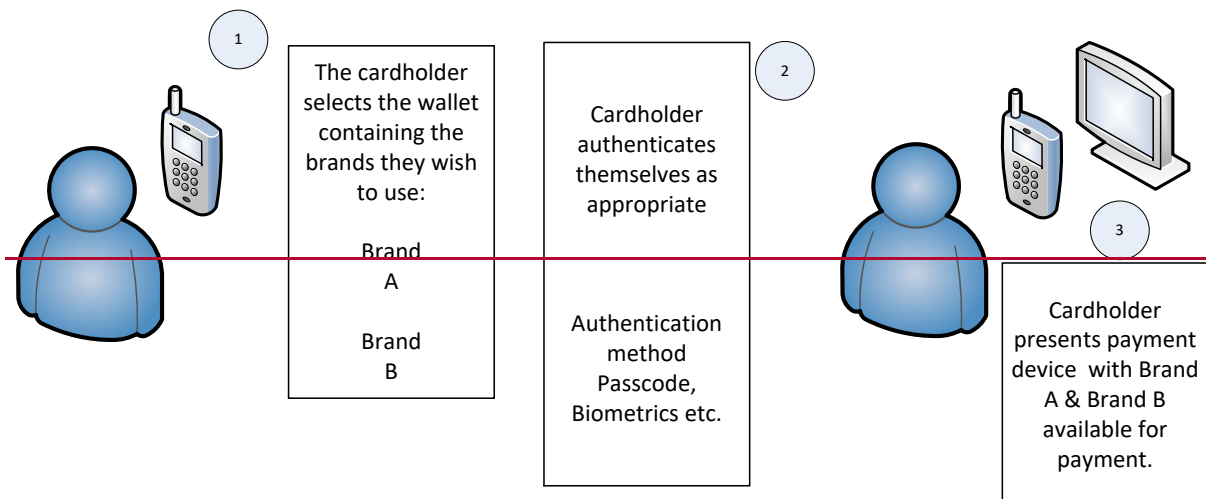

Figure 15: ~~EXAMPLE 9: CONTACTLESS – CHOICE OF APPLICATION WITH A MOBILE DEVICE SUPPORTING MULTIPLE APPLICATIONS~~

2.2.3. Remote - Virtual POI: Manual Entry by Cardholder

The method of using acceptance names and logos of payment brands in conjunction with BIN tables for Product Identification is an Acceptor implementation option.

Some implementation examples are illustrated in the following sections

2.2.3.1. Example 10: Remote - Cardholder selection using brand logos

In this particular example the acceptor has not implemented a priority selection, consequently the Cardholder is presented with all supported payment methods.

The following steps apply:

- The Cardholder's choice is performed by selecting a Brand logo;
- The Cardholder manually enters the PAN, Expiry Date and Card Security Code (CSC);
- The Cardholder submits the payment information.

Payment method: ☐ ☒ Brand A ☐ Brand B ☐ Brand C

Card Number:

Expiry Date:

Card Security Code:

Figure 13: EXAMPLE 10: REMOTE - CARDHOLDER SELECTION USING BRAND LOGOS

2.2.3.2. Example 11: Remote - Acceptor's priority selection using BIN / IIN tables with a Cardholder's override mechanism

Step 1: Card detail entry

The Acceptor displays all brands accepted. When choosing to pay by Card, the Cardholder is asked to input the PAN of the Card they wish to pay with.

Payment method: ☒ **Card** ☐ Brand A ☐ Brand B ☐ Brand C

☐ Digital wallet A

☐ Digital wallet B

Card Number:

Expiry Date:

Card Security Code: ?

Figure 14: EXAMPLE 11 (STEP 1): REMOTE - CARD HOLDER ENTERS THEIR CARD DETAIL

Step 2: Acceptor product identification

If the Cardholder uses a cobadged Card, the Acceptor's Virtual POI uses IIN/BIN tables to identify the Card brand and category to determinate their preferred Card brand and category, and presents their preference to the Cardholder.

In case of returning Customer with their Card On File for the Acceptor, the Payment Brand selected by the Customer for their previous purchase may be presented as the first choice, with the possibility to change it.

Payment method: ☒ **Card** ☐ Brand A ☐ Brand B ☐ Brand C

☐ Digital wallet A

☐ Digital wallet B

Preferred Selected Card application

Card Number:

Expiry Date:

Card Security Code: ?

Figure 15: EXAMPLE 11 (STEP 2): REMOTE - ACCEPTOR PRODUCT IDENTIFICATION

~~In case of returning Customer with their Card On File for the Acceptor, the Payment Brand selected by the Customer for their previous purchase may be presented as the first choice, with the possibility to change it.~~

Step 3: the Cardholder exercises their override right

An option to change the Acceptor's (or Customer's) preference is provided to the Cardholder by choosing the "more choice" option. The Acceptor display all the supported Card brands and categories and may put their preferred Card brand and category on top of the list.

Payment method: ☒ Card ☐ Digital wallet A ☐ Digital wallet B

Brand A Brand B Brand C

Card application available for choice

Card number: 4571 04xx xxxx xxxx Debit Brand B Debit Brand C

Valid through: Month Year

Security code: ?

Figure 16: EXAMPLE 11 (STEP 3): REMOTE - THE CARDHOLDER EXERCISES THEIR OVERRIDE RIGHT

2.2.4. Implementation guidance for Language Preference during Choice of Application

When implementing the IFR choice of application for contactless transactions, there may be occasions when the acceptor would like to use the cardholders preferred language for the display, but the Language Preference data element (5F2D) is not immediately available.

An example would be when the POI reads the PPSE, discovers multiple mutually supported applications and wishes to present them to the cardholder for selection.

As the Language Preference is not available within the PPSE, the POI may know of other mechanisms for retrieving the language preference, for example by issuing a SELECT command for one of the returned applications in order to retrieve tag '5F2D' from the application's FCI, if present. However, these mechanisms are outside of the scope of this book and are not described further.

2.2.5. Implementation guidance on Display on Brand and Product Type for Acceptance

The Acceptor shall display the accepted Brands. If not all Product Types of a Brand are accepted, the Cardholder shall be informed which Product Type(s) are not accepted per Brand. For Local Transactions, this shall be at the entrance of the shop and the POI. For Remote Transactions, this should be at the latest, on the payment page.

2.2.6. Implementation guidance on Visual Product Identification

The appropriate Card category for Visual Product Identification shall be displayed on the Card or consumer device in English, as follows;

- Prepaid
- Debit
- Credit
- Commercial

If required by local regulation, the Card category may additionally be displayed in the local language.

2.3. GDPR Implementation Guidelines

In the context of card based payments, the GDPR applies to all circumstances where personal data is provided or processed. However, due to the increased use of data in the [EMV 3DS] specification, further guidance when implementing those specifications is given below.

2.3.1. [EMV 3DS] solutions and GDPR

[EMV 3DS] (3-domain security) is strongly recommended for e-/m commerce transactions as a method of implementing Strong Customer Authentication (SCA). However, it should be understood 3DS solutions may process data elements that are considered to be personal data under the GDPR. Data collected may include data of cardholders and merchants, and where merchants are sole traders, certain merchant data may be considered personal. All entities processing personal data in the context of 3DS solutions are individually responsible for identifying and complying with the relevant obligations under the GDPR. Accordingly, all entities should seek legal advice when considering the GDPR consequences of providing and processing data that may be considered to be personal data.

Specific principles to consider include:

- Lawful basis for processing: All entities should ensure they can rely on a lawful basis under the GDPR to process personal data in the context of 3DS solutions. For most of these solutions, all entities may rely on legal bases other than consent including legal obligation, contract and legitimate interest for using personal data for fraud prevention purposes.
- Purpose limitation: Data provided by merchants for 3DS authentication must not be used for any purpose other than authentication and fraud prevention. Specifically, this data should not be used for sales marketing or other purposes.

- Data storage and security: All entities should ensure that the requirements for data storage, security and international transfers under GDPR are applied to any personal data that is collected for 3DS solutions.
- Data minimisation: Data collected must be limited to what is necessary in relation to 3DS authentication. Further data should not be collected if the available data allows for SCA.
- Transparency and Individual Rights: All entities should ensure that Terms and Conditions, Privacy Policies and Privacy Notices reflect the capturing and processing of data for fraud prevention purposes in the context of 3DS solutions. This includes information on purposes for processing their personal data, the retention periods for that personal data, and who it will be shared with. In addition, all entities should ensure that they can respond to individuals' requests under the GDPR.
- Accountability: Organizations must document data processing in the context of 3DS solution, ensure data protection impact assessment, where required, and consider privacy by design and by default measures.
- Where sensitive personal data may be collected for the purpose of 3DS solution, including biometric data such as fingerprint, facial features, or iris format, the entity involved is responsible for ensuring additional safeguards under the GDPR, such as for example obtaining explicit consent.

2.4. PSD2 Implementation Guidelines.

The following section provides guidelines for specific transaction types under [PSD2] - [RTS SCA/CSC].

2.4.1. Article 11 – Considerations for low value contactless transactions.

Article 11 of [RTS SCA/CSC] introduces exemptions to Strong Customer Authentication (SCA) for contactless transactions.

One method for controlling the correct implementation of the contactless exemptions is for the Issuer to implement a host-based solution, using specific response codes indicating that SCA is required.

If this Response Code option is used, four possible transaction flows have been identified:

- SWITCH INTERFACE
(Cardholder is asked to switch interface from contactless to contact)
- RE-PRESENT CARD AND ENTER PIN
(Cardholder is asked to re-tap card and enter PIN)
- ENTER PIN WITHOUT A SECOND TAP
(Cardholder is asked to enter PIN – initial transaction data will be used)

- DECLINE

(There is no valid method of performing CVM with the device presented)

Another method of controlling the implementation of contactless exemptions is through the use of Card based controls, but this method is out of scope of The Volume.

Issuers will need to consider, inter alia, the following factors when deciding whether to use Issuer Host or Card based controls to manage contactless exemptions:

- Market capabilities – support of online/offline PIN
- Card capabilities – support of various CVM methods
- Form factor and device capabilities

2.4.2. Article 12 – Considerations for identifying unattended terminals for transport fares and parking fees

Article 12 of [RTS SCA/CSC] introduces exemptions to Strong Customer Authentication (SCA) for transactions performed on unattended terminals for transport fares and parking fees.

- Terminal Type may be used to identify the terminal as unattended.
- The following MCCs ~~(as of July 2019)~~ may be used to identify transport and parking sectors:
 - 4111 Transportation - Suburban and Local Commuter Passenger, including Ferries
 - 4112 Passenger Railways
 - 4131 Bus Lines
 - 4784 Bridge and Road Fees, Tolls
 - 4789 Transportation Services—not elsewhere classified
 - 7523 Automobile Parking Lots/Garages
 - ~~4111 Local and Suburban Commuter Passenger Transportation including Ferries~~
 - ~~4112 Passenger Railways~~
 - ~~4131 Bus Lines~~
 - ~~4784 Tolls and Bridge Fees~~
 - ~~7523 Parking Lots and Garages~~

Additional data may be used to identify transactions related to transport fares or parking fees.

2.4.3. Acceptor Initiated Transactions

The following subsection provides guidance on Acceptor Initiated Transactions, where 2.4.3.1 covers guidance on MITs and 2.4.3.2 covers Acceptor Initiated Transactions where merchants are the payer, i.e. refund services.

2.4.3.1. Merchant Initiated Transactions

The following section provides guidelines relevant to the implementation of Strong Customer Authentication (SCA) under PSD2 specific to Merchant Initiated Transactions (MITs). The guidelines are written for business, technology and payments managers responsible for the planning and implementation of PSD2 compliance policies and solutions within Issuers, Acquirers, Merchants, gateways and Vendors. It aims to provide readers with guidance to support business, process and infrastructure policy decisions needed to plan for the implementation of MITs.

The following guidelines apply when the Cardholder and Merchant establish the Merchant Initiated Transaction agreement (MIT Mandate) electronically. The establishing of ‘non-electronic’ mandates are outside of the scope of the Volume.

2.4.3.1.1. Authorisation and Authentication flow

Cardholder signs up to a new agreement for future Merchant Initiated Transactions (MIT Mandate)
1. Merchant discloses to Cardholder appropriate T&Cs and follows other requirements associated with the future MIT type it will process. The Cardholder must explicitly accept the T&Cs for the agreement to proceed.
2. Acceptor/Merchant requests an SCA of the Cardholder by the Issuer for the “authenticated amount”.
3. Merchant requests authorisation from the Issuer for the amount due that day and stores the transaction ID of this Authorisation for later use as the Initial Tran ID in future MITs. If an Authorisation is not necessary at the time of setting up the mandate, then SCA may be achieved through a zero amount “account status” type transaction. This type of functionality is supported in EMV 3DS 2.1 and above.

This first Authorisation is a transaction initiated by the Cardholder used to establish the agreement for future MITs. If the Authorisation is approved, the payment credentials can be stored for future use. If the credential is not stored, the details can be kept but only as long as required in order to complete the current transaction agreement (e.g. to process any industry specific MITs such as No-Shows).

Cardholder uses service leading to additional payments

4. The Acceptor/Merchant ***initiates authorisation requests*** future MITs. The initial transaction ID to use is the one generated in step 3. The amount in future MITs may vary from the original amount as long as the amount calculation method is disclosed to the Cardholder in the T&Cs of the established agreement. Any amount variance should not be a concern, as the transaction is an MIT and therefore is considered to be out of scope of SCA.

2.4.3.1.2. Types of Merchant Initiated Transactions

Below are examples of types of MITs. For clear definitions the reader can refer to Book 1 section 3.3.

Instalment	Instalment payments describe a single purchase of goods or services billed to a Cardholder in multiple transactions over a period of time agreed by the Cardholder and Merchant.
Recurring Payment	Recurring Payments describe transactions where the Cardholder authorises an Acceptor to charge their account on a recurring basis and without a specified end date. Note that a recurring MIT transaction is initiated by the Merchant (payee) not the Cardholder (payer) and so is considered to be out of scope of PSD2.
No- Show	A No-show is a transaction where the Merchant <u>Acceptor</u> is enabled to charge for services which the Cardholder entered into an agreement to purchase, but did not meet the terms of the agreement.
<u>Staged Wallet funding</u>	<u>The transaction to fund the Staged Wallet using a linked Card may be considered as a MIT, where the operator of the Staged Wallet is considered as the Acceptor.</u>

These types of MITs occur where a ~~new Transaction-transaction~~ is initiated by the ~~Merchant Acceptor~~ under an existing established agreement ~~and are therefore considered to be out of scope of SCA. However, to establish such an agreement, an initial transaction must be performed that was initiated by the Cardholder, when the mandate is set up or Ts&Cs agreed.~~

2.4.3.2. Refund transactions

Although Refunds are initiated by the Merchant, due to the different flow of funds, the Merchant is considered to be the Payer. As the merchant is the Payer, the PSD2 requirement that the Payer's PSP, i.e. the Acquirer, authenticates the Payer still applies. The following two factors can be used by the Acquirer to perform SCA of the Merchant for Refund transactions:

- Possession factor: Terminal ID in an Authorisation request message indicates to the Acquirer that the Merchant is in possession of the hardware that is assigned to the Merchant.
- Knowledge factor: before starting the session and initiating a Refund transaction, retail co-workers typically have to enter a password to access the systems that allow them to perform the initiation of refunds. Book 2 of the Volume requires that sensitive functions, such as Refunds have password protection as a configurable option. The use of this functionality is strongly recommended.

The PSP of the Merchant, the Acquirer, may therefore also apply exemptions under the RTS for the refund transactions, including the Article 17 exemption for Secure corporate payment processes and protocols.

2.4.4. Transactions where the final amount is not known

There are a number of use cases where the final transaction amount is not known at the time the transaction is performed. Whilst this is not a new situation, PSD2 has introduced challenges related to strong customer authentication and the dynamic linking of transactions.

- In order to meet PSD2 requirements of SCA and dynamic linking in all circumstances, to minimise the amount of friction in the transaction, and to prevent the issuer from trying to authenticate the cardholder when they are no longer there, Merchants may implement MITs as described in section 2.4.3.1.1.
- If a Merchant is unwilling or unable to use MITs, in order to reduce declines, the Merchant should authorise and authenticate for a maximum amount, explaining to the Cardholder that this is an estimated amount and the final transaction amount may be lower. Note; if the final transaction amount is higher than the authenticated amount the transaction is likely to be declined by the Issuer because of the dynamic linking requirements.
- In order to meet dynamic linking requirements it is strongly recommended to perform authorisation and authentication at the same time and for the same amount.

2.5. PSD2 Implementation Guidelines- EAA implementation guidelines recommendations

2.5.1. EAA requirements

Directive (EU) 2019/882 of the European Parliament and of The Council on the accessibility requirements for products and services [EAA] was adopted on 17 April 2019. The Directive aims to contribute to the proper functioning of the internal market by approximating laws, regulations and administrative provisions of the Member States as regards accessibility requirements for certain products and services by, in particular, eliminating and preventing barriers to the free movement of certain accessible products and services arising from divergent accessibility requirements in the Member States.

Article 15 of the Directives refers to harmonised standards for product accessibility requirements. The best currently available standard is ETSI's EN 301 549 V3.2.1 (2021-03) document [~~ETSI~~EN AR].

The ~~EP~~CSG intends to give examples of how accessibility requirements can be implemented in the use cases but cannot be exhaustive. The ~~EP~~CSG's intention is to provide guidance that could be used by the readers to make their own analysis for the actual implementation.

2.5.2. Examples of use cases as guidance to apply [EAA]

The purpose of this section is to illustrate how accessibility presumption of conformity (according to Article 15 of the Directive) can be achieved by applying the available requirements in the EN document.

2.5.2.1. Example 1 – Local Transaction – Physical POI – visually impaired person

Section 5.1.3 describes the non-visual access requirements applicable in this use case suggesting alternative ways to screen reading through assistive technologies (e.g. audio prompts of displayed information such as the transaction amount).

Section 8.4.1 describes the requirements for keyboard features allowing the input of the PIN number on the terminal.

The amount and any relevant information is spoken by the terminal using speech generation software so that the cardholder is made aware of the correct transaction details. After that, if requested, the cardholder can enter their PIN on the POI.

When a mechanical PIN-pad is provided, the cardholder will be guided by “the number five key tactilely distinct from the other keys of the keypad” (section 8.4.1). [Also see ISO 9564-1:2017 (E), Annex B.]

The Royal National Institute of Blind People [www.rnib.org.uk] published a paper outlining how the cardholder will be guided by audible prompts (naturally not speaking out the actual figures for security reasons) to select the correct keys for the PIN when a touch-screen PIN-pad is used.

“Finding a reference point can help to begin the transaction. Often this means starting in a corner and sliding the finger onto the screen to find the first number. Number 1 is found in the top-left corner. The numbers cannot be spoken for security reasons, so a beep can be heard instead. Then, keeping the finger on the screen, moving from this digit to the next digit, for example, move to the right from number 1 for number 2 on a standard telephone keypad, and another beep will be heard. The buttons cancel and OK are spoken so these can also be used as a reference point.

Once the correct digit has been found by listening to the beeps, the cardholder double taps anywhere on the screen to enter the digit. A sound will confirm that a digit has been entered and in most cases it’ll say how many digits have been entered. If the cardholder’s finger lifts off the screen by mistake, no digit is entered until double tapping.

FIGURE 17: EXAMPLE OF ACCESSIBLE PIN PAD DESIGNED FOR ENHANCED READABILITY

After entering the PIN digits the cardholder moves the finger to the *enter* or *OK* button at the bottom right then lifts the finger and double taps anywhere on the screen to confirm the transaction.

There’s also the option to cancel the transaction, by selecting the cancel button on the bottom left, before doing a double tap to confirm the cancellation.”

[[https://media.rnib.org.uk/documents/How to use an accessible touchscreen chip and PIN 2022.pdf](https://media.rnib.org.uk/documents/How%20to%20use%20an%20accessible%20touchscreen%20chip%20and%20PIN%202022.pdf)]

2.5.2.2. Example 2 – Remote Transaction - Virtual POI – visually impaired person

Besides section 5 where generic requirements apply, section 9 of the EN document regarding web requirements will be used to define the conformity with the Directive.

2.5.2.3. Example 3 - ATM – visually impaired person

In this example, section 8.2, Hardware products with speech output, will have particular relevance in determining the conformity with the Directive.

3. GENERAL BEST PRACTICES FOR IMPLEMENTATION ~~GENERAL IMPLEMENTATION GUIDELINES~~

3.1. Selection of Payment Solution

A Payment Solution is defined as the combination of a Payment Instrument (e.g., Payment Card or Instant Credit Transfer), a Payment Brand, and an Acceptance Technology (such as NFC, Chip Contact, or QR Code). Given these components, there is considerable variability in how a Payment Solution may be presented and selected at the POI.

While the functional and technical requirements related to this topic are defined in Book 2, Book 6 provides additional guidance on implementation for ensuring interoperability, supporting the coexistence of different payment methods, optimising the user experience, and accommodating a wide range of acceptance scenarios.

The following selection trees are described as representative of common market implementations:

1. Open-to-all (attended or unattended) POI
2. Payment Instrument selection first
3. Interface technology selection first

It is understood that IFR provisions regarding the choice of application apply to Payment Solution selection scenarios for both contact-based and contactless (NFC) transactions conducted over card payment rails.

3.1.1. Open-to-all (attended or unattended) POI

Prerequisites:

All accepted Payment Brands (for supported Payment Instruments) are clearly displayed and visible at the POI.

No (verbal) guidance is required.

The POI has the capability to simultaneously detect the presence of a Card on-NFC/contactless and contact interfaces, to display a (multi-brand) QR Code and to read a QR Code. Additionally, the POI can in parallel receive the payment confirmation message (for a transaction with ~~merchant-presented~~ QR Code option).

Step 1: POI activation

The Acceptor activates the payment interfaces by:

- Opening the NFC/contactless and contact interfaces, and simultaneously
- Displaying a dynamic, multi-brand QR Code on the terminal screen.

At this stage, the selected Payment Brand is not yet known to the POI.

Step 2: Customer initiates the payment

The Customer selects one of the available options:

a. Cash (out of Volume scope)**b. Contact or contactless/NFC**

The Customer inserts the Ceard or taps the eCard or Mobile Device in the dedicated area of the POI.

Based on the information exchanged via contact or NFC and entry point interaction, the Payment Brand is selected at this stage and the POI initiates the appropriate flow resulting in a Card Transaction or ICT Transaction where the ICT Transaction may be processed over card rails or ICT rails.

c. Merchant-presented QR Code

The Customer scans the QR Code displayed on the terminal, typically using a payment app in their Mobile Device. In some cases, scanning via smartphone camera may occur: the PISP typically provides the landing page where the QR Code directs the Customer for checkout.

The Customer initiates the ICT Transaction via the payment app or the flow enabled within the landing page.

The POI awaits payment confirmation and final approval.

d. Consumer-presented QR Code

The Customer uses their Mobile Device to (generate or retrieve and) present a QR Code to the Acceptor who scans it.

The POI initiates the corresponding ICT-based payment flow and awaits payment confirmation and final approval.

3.1.2. Payment Instrument selection first**Prerequisites:**

All accepted Payment Brands (for supported Payment Instruments) are clearly displayed and visible at the POI.

(Verbal) guidance is required.

Step 1: POI activation

The Acceptor prompts the Customer to select the Payment Instrument first, e.g., the terminal shows cash/card/bank transfer icons inviting the Customer to click their choice. Based on the Customer's choice, the POI activates the appropriate flow.

Step 2: Customer initiates the payment**a. Cash (out of Volume scope)****b. Payment Card**

Contact or Contactless/NFC interface is activated.

Refer to the description for Contact or Contactless/NFC in the Open-to-all flow.

The payment results in a Card Transaction.

c. ICT

Contactless/NFC interface is activated. Refer to the description for Contactless/NFC in the Open-to-all flow.

A dynamic, multi-brand QR Code is presented on the terminal screen simultaneously. Refer to the description for Merchant-presented or Consumer-presented QR Code in the Open-to-all flow.

The payment results in an ICT Transaction that may be processed over card rails or ICT rails.

3.1.3. Interface Technology Selection First

Prerequisites:

All accepted Payment Brands (for supported Payment Instruments) must be clearly displayed and visible at the POI.

(Verbal) guidance is required.

Step 1: POI Activation

The Acceptor prompts the Customer to select the technology interface first (e.g., the teller at the attended POI asks the Customer whether they want to pay using contact, contactless, or QR Code) and activates the payment interfaces accordingly by:

- Opening the contact reader interface, or
- Opening the contactless/NFC interface, or
Contact and contactless/NFC interfaces are usually opened simultaneously
- Displaying a dynamic, multi-brand QR Code on the terminal screen, or
- Requesting the Customer to present a QR Code to a dedicated reader.

At this stage, the selected Payment Brand is not yet known to the POI.

Step 2: Customer Initiates the Payment

a. If Contact or contactless/NFC

Refer to the description for Contact or Contactless/NFC in the Open-to-all flow.

b. If QR Code

Refer to the description for Merchant-presented and Consumer-presented QR code in the Open-to-all flow.

3.2. Guidelines based on ERPB recommendations on transparency for retail payment end-users

~~1.1.1.~~ Commercial trade name

To improve identification of whom, where and when the Customer made a Payment based on Customer's Payment Account statement or corresponding application, the ERPB set up a working group to define recommendations.

3.2.1. Commercial trade name

The first ERPB recommendation on transparency for retail payment end-users outlines the following:

"Consistently use commercial trade name and provide this name to all involved parties in the payment chain for use in client's payment account statements."

It is critical that the Acceptor name used throughout the transactions is recognisable by the Cardholder so that transactions can be correctly identified. If the legal name is different from the Acceptor's commercial trade name, the legal name may be meaningless to the cardholder. The Acceptor name must be the name most prominently displayed by the Acceptor and by which Cardholders recognise the Acceptor.

For that reason, the following section provides examples and guidance on how such Commercial Trade Name may be used.

3.2.1.1. Example One: Fuel station franchise

A fuel station is a franchisee of a large retail chain. Accordingly, the retail chain name, brand, and colors are prominently displayed on the forecourt and inside the shop. The name of the franchisee is in the window on an A4 notice for legal reasons. The Acceptor name must be the name of the retail chain, possibly with an added indication of the location.

3.2.1.2. Example Two: Online marketplaces (payment aggregator)

A type of marketplace, also known as “payment aggregator”, “facilitator”, or “master merchant” is defined as an intermediary that processes and collects payments for merchants (sometime called “sub-merchants”, or “ultimate payees”). In this case it is recommended that the Acceptor’s Commercial Trade Name (master merchant) appears on the payment followed by, if possible, e.g. “payment processed for” followed by the commercial trade name of the sub-merchant.

3.2.1.3. Example Three: Online marketplaces

Another type of marketplace is defined as an intermediary that does not process and collect payments. A Customer buys items from a supplier present on such marketplace, and the beneficiary (payee) of the payment is that supplier. It is recommended that in this case of marketplaces the name appearing on the payment account statement is formatted as commercial trade name of the ultimate payee (the supplier) and followed by e.g. “ - your order from”, followed by the commercial trade name of the marketplace on which the client placed the order.

3.2.2. End-to-end data transmission standards for processing

The fifth ERPB recommendation on transparency for retail payment end-users outlines the following:

“Use standards and applications suitable for including identified data sets “end-to-end”. Upgrade or change these standards when necessary.”

The ERPB document further detail the following guidance to secure data to be processed from an end-to-end perspective:

“All processing entities involved in the payment chain should use standards and applications that are able to collect and transmit the requested information from the beginning of the payment process to the end (payment account statement provided to the Customer). The technical protocols should be interoperable and should support the full data set as listed in these recommendations, end-to-end. The data fields should not be limited in character number such that they pose an obstacle to the successful transmission of this information.

The standards and applications should be adapted to the information needs of the Customer and not the contrary.

Considerations should be made to upgrade any protocols in current use that are unable to collect or transmit the information set out in these Recommendations. An alternative might be to migrate to standards that can collect and transmit this information.”

3.1.3.3. Guidelines for non-standard card acceptance.

3.1.1.3.3.1. Cardholder Verification Method – Signature

The European Banking Authority (EBA) has clarified that the capturing of a Cardholder’s signature on a paper slip cannot be considered as a behavioural biometric. Nor can a paper based signature constitute knowledge or possession. As a result, the capturing of a paper based signature cannot be used to meet Strong Customer Authentication requirements as defined in PSD2.

However, there may be legitimate needs for a Merchant to capture a signature, such as one leg in transactions or to support refund processes and so signature capture is described in The Volume.

3.1.2.3.3.2. Magnetic Stripe Capture

Although Magnetic Stripe capture is not considered a secure method of performing card based transactions in SEPA, there may be legitimate business needs for a Merchant to read a magnetic stripe, such as one leg in transactions or fallback transactions and so magnetic stripe capture is described in The Volume.

3.2.3.4. Data Capture

3.2.1.3.4.1. Data capture for physical POI

The Terminal to Host Capture of Online/Offline Transactions is realised with one of the following mechanisms

- Capture by Authorisation;
- Capture through completion message;
- Capture by Batch/File;

- Or can be a combination of these three methods.

The following three configurations, called 'Modes' of the POI Acquirer Protocol are recommended:

Mode 1:

- Online Authorisation without capture for online transactions,
Followed by/or
- Capture immediately after transaction finalisation regardless whether Authorisation was online or offline.

Mode 2:

- Online Authorisation without capture for online transactions,
Followed by/or
- Capture by a batch transfer for a group of transactions regardless whether Authorisation was online or offline.

Mode 3:

- Capture with Authorisation for transactions Authorised online;
- Capture immediately after transaction finalisation if Authorisation was performed offline.

The method used is based on an agreement between Acceptor and Acquirer.

Examples

For each Mode, the typical message flows below show when the Authorisation is performed online. If the Authorisation is performed offline, the online Authorisation request and response in the flows should be disregarded. In Mode 3, if the Authorisation is performed offline, an additional Financial Advice exchange must be executed to perform the Data Capture.

Mode 1: Online Authorisation, Capture immediately after Transaction Completion

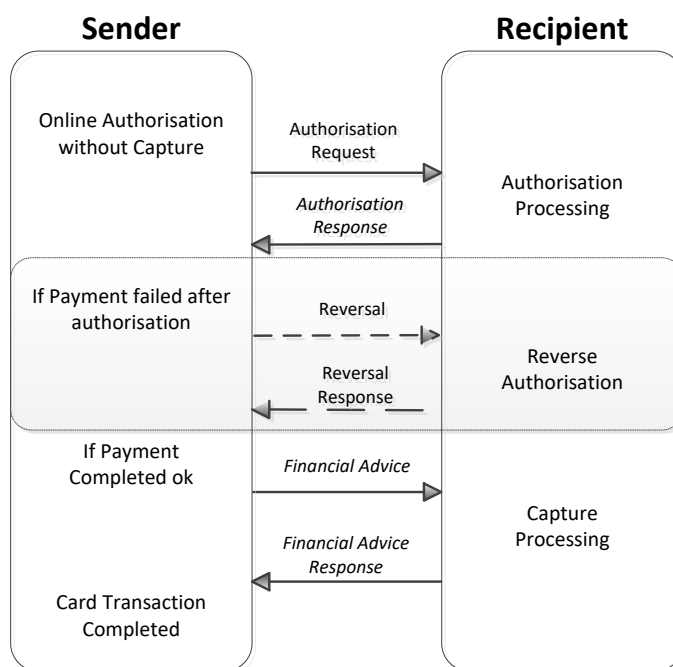

FIGURE 18: MODE 1

Mode 2: Online Authorisation, Capture by Batch

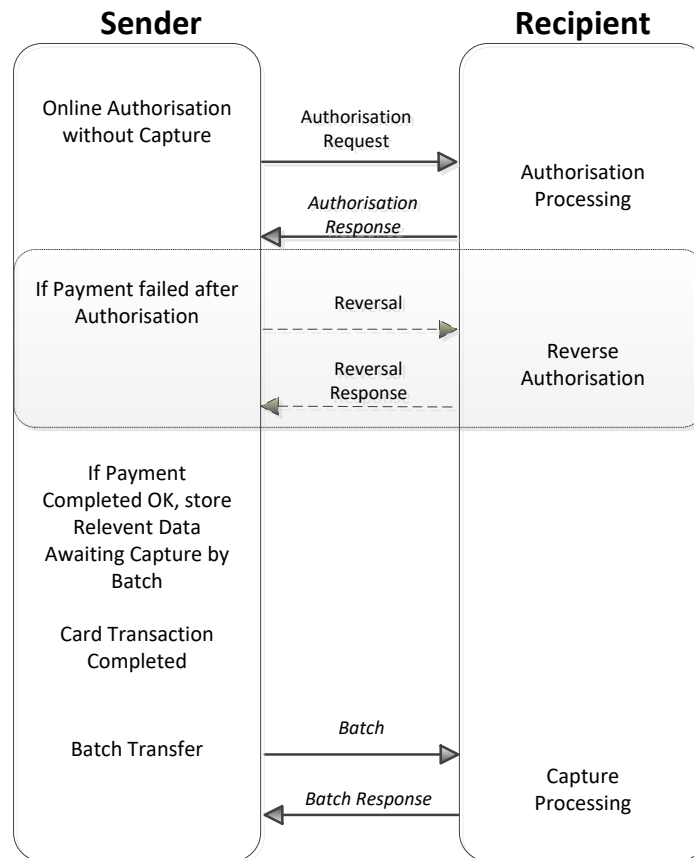

FIGURE 19: MODE 2

Mode 3: Online Authorisation with Capture

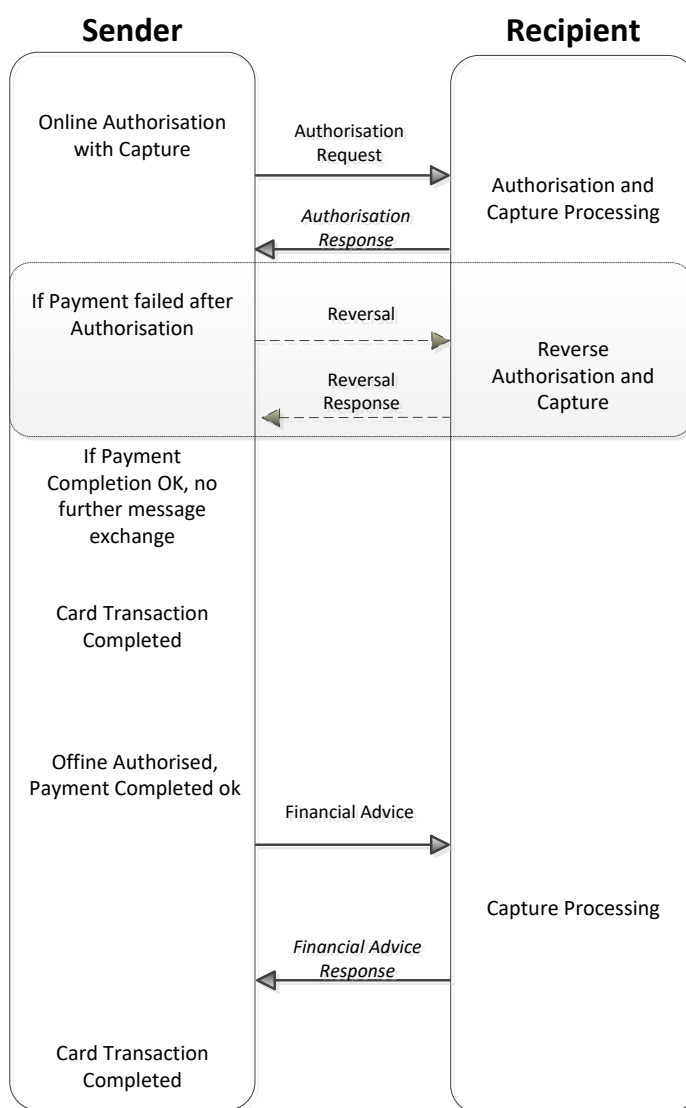

FIGURE 20: MODE 3

3.3.3.5. Integration modes for Card Account Data Retrieval for in Virtual POI environments

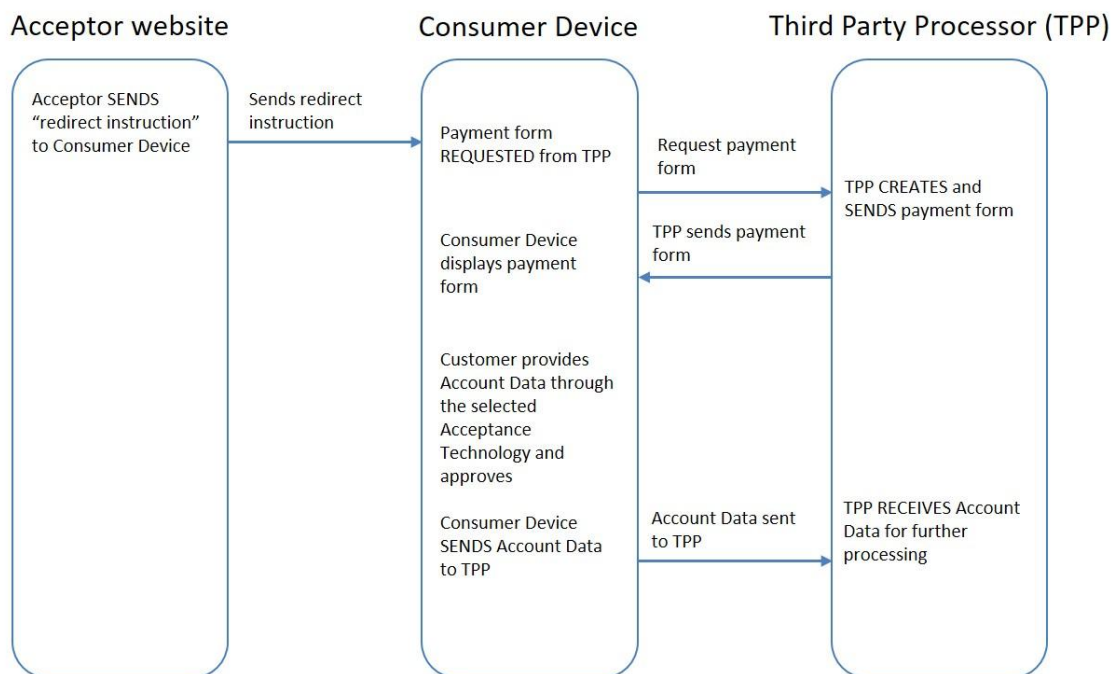

The following examples are typical configurations representing integration modes between the Acceptor and the Third-Party Processor (TPP) for retrieving card data Account Data in a Virtual POI environment.

- The redirection process
- The iFrame
- The direct post
- The JavaScript created form
- The API (sometimes called the Merchant gateway)

For each of the configurations a stepwise description is provided below for the transmission of the ~~card~~ Account Data in the case of E- and M- Commerce ~~with card data manually entered by the Customer. In all these examples, the Customer provides Account Data through the selected data entry method~~ Acceptance Technology (i.e. one among those available such as Manual Entry, digital wallet, or Stored Card Data or Consumer Device).

3.3.1.3.5.1. The redirect process

The following figure illustrates the different steps involved in the configuration whereby the ~~cardholder's customer~~ Consumer Device is redirected to a TPP to request a payment page. This configuration imposes the lowest risk for the A ~~acceptor~~.

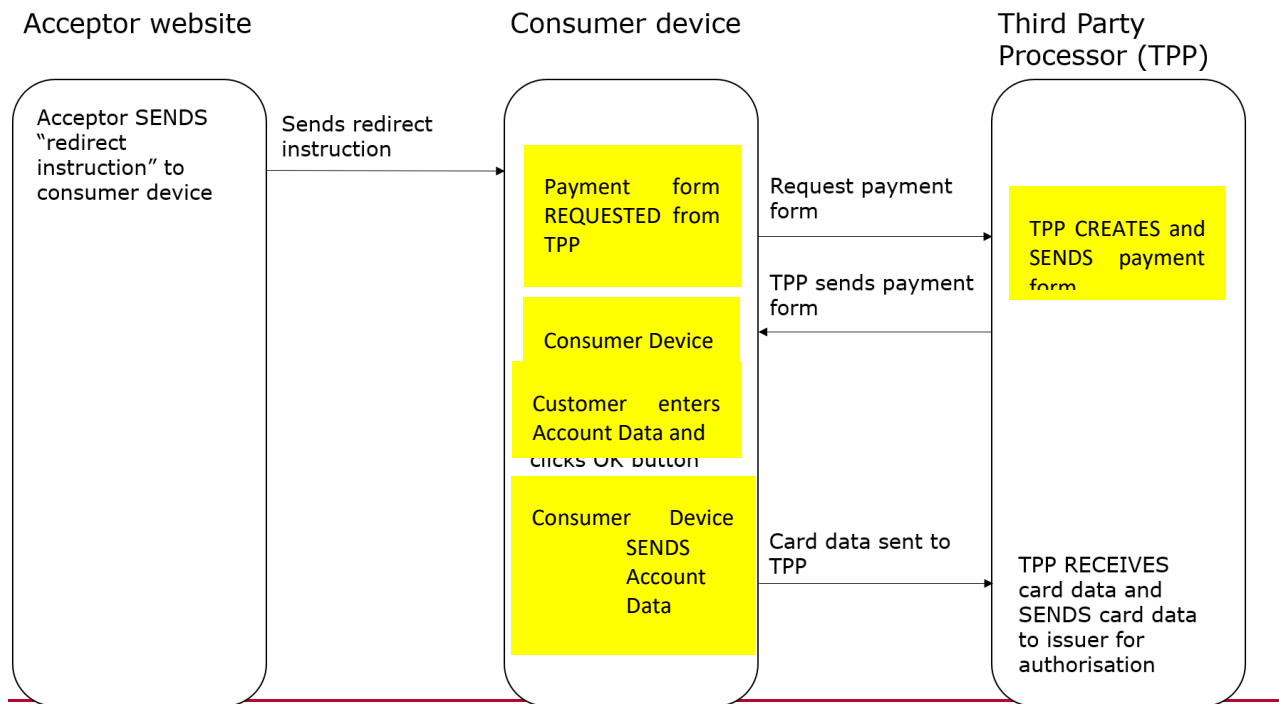

FIGURE 21: THE REDIRECT PAYMENT PROCESS

3.3.2.3.5.2. The IFRAME

The following figure illustrates the different steps involved in the configuration whereby the cardholder's customer dConsumer Device is redirected to a TPP to request a payment page via a so-called parent payment page obtained from the Aacceptor's website.

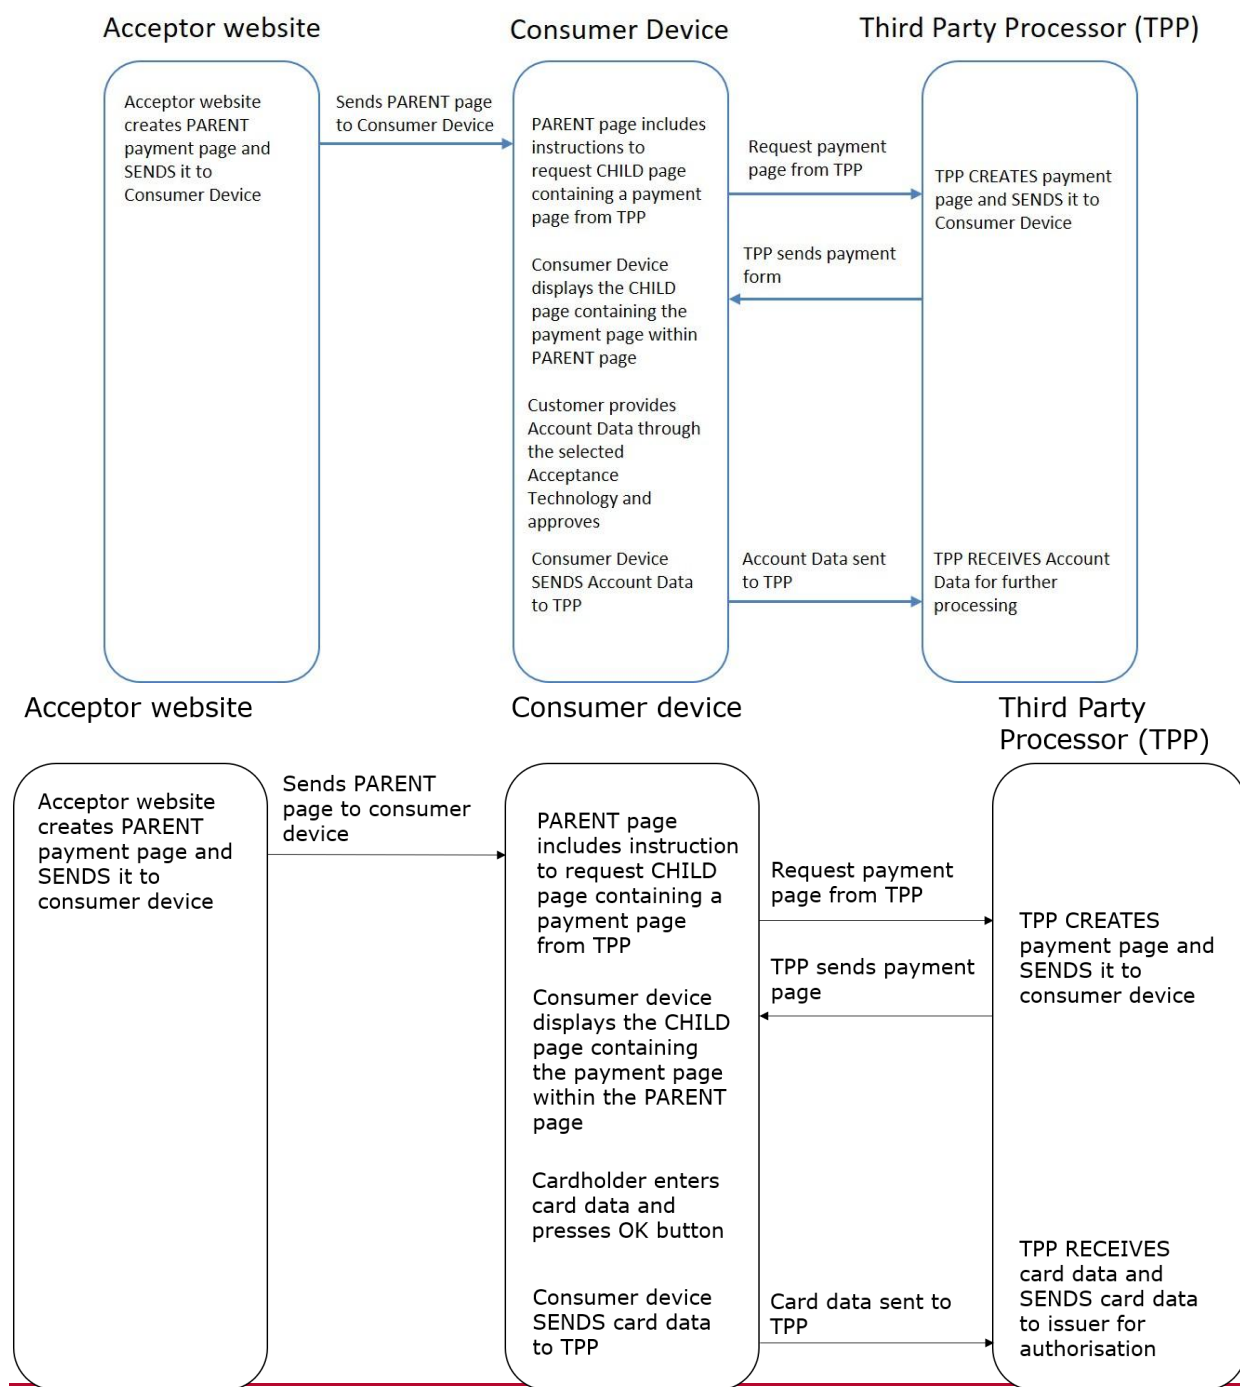

FIGURE 22: THE IFRAME

3.3.3.3.5.3. The direct post

The following figure illustrates the different steps involved in the configuration whereby the cardholder's customer Consumer dD device is displaying the payment page. This configuration is also sometimes referred to as "browser API" or "silent post".

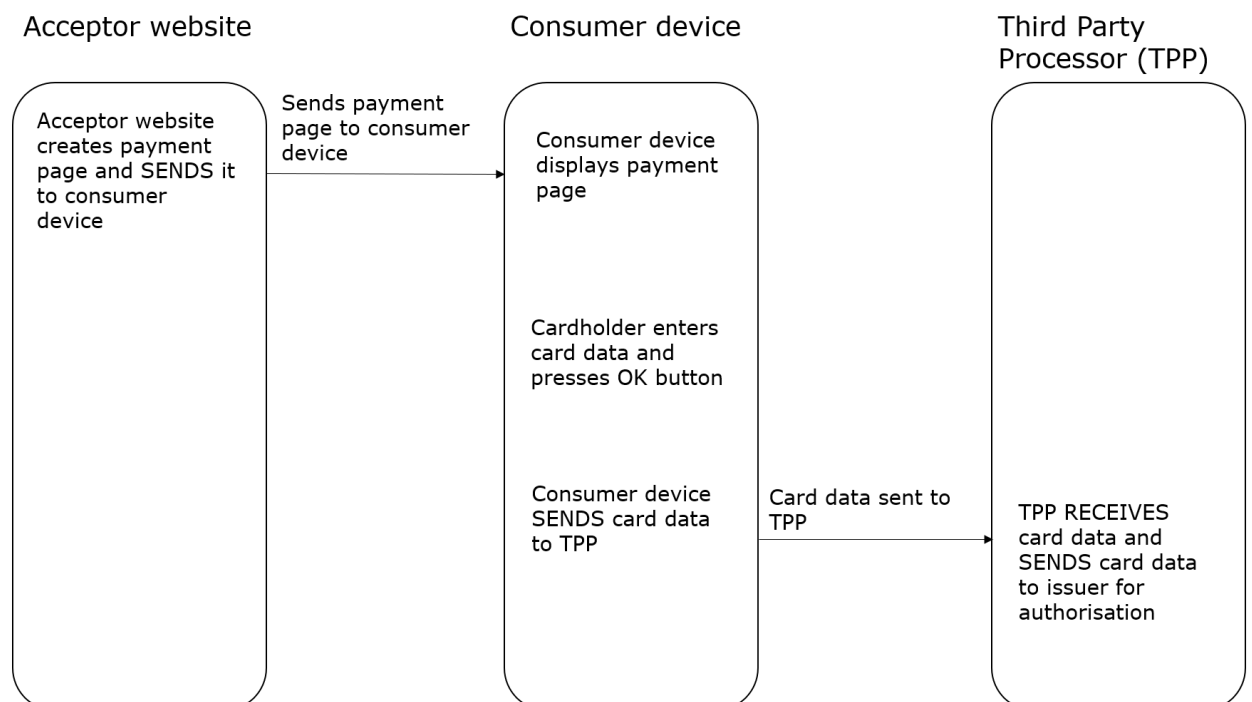

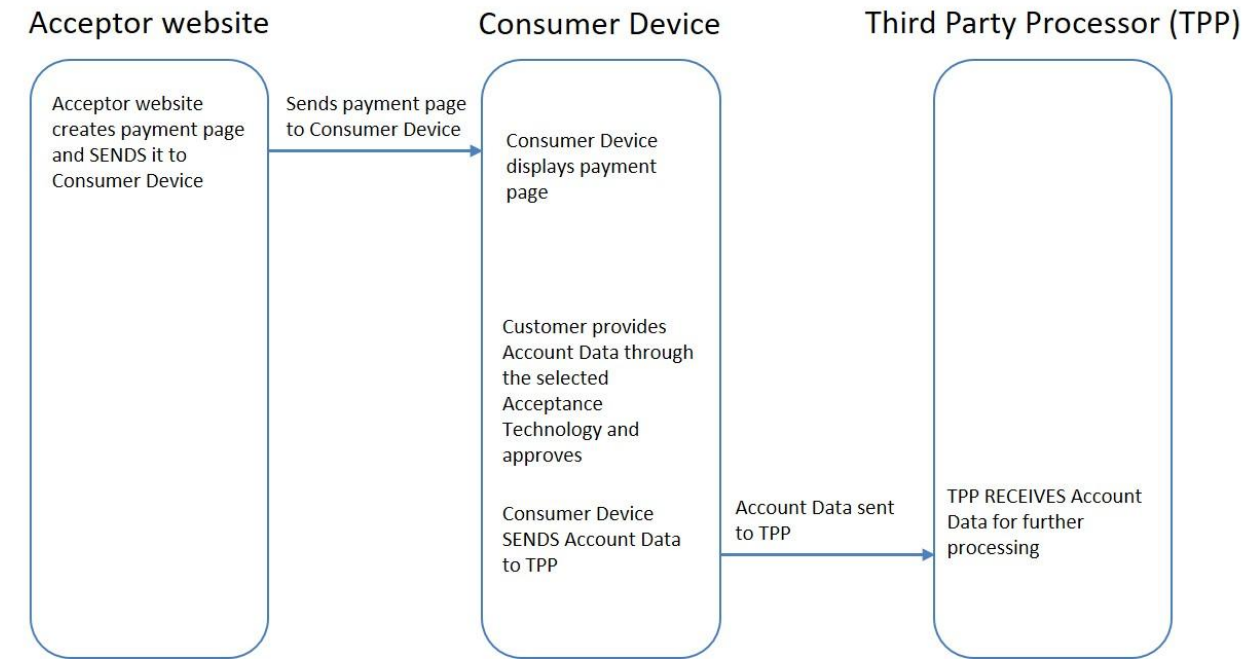

FIGURE 23: THE DIRECT POST

3.3.4.3.5.4. The JavaScript created form

The following figure illustrates the different steps involved in the configuration whereby the ~~cardholder~~ Customer is presented with a form created in JavaScript within the payment page.

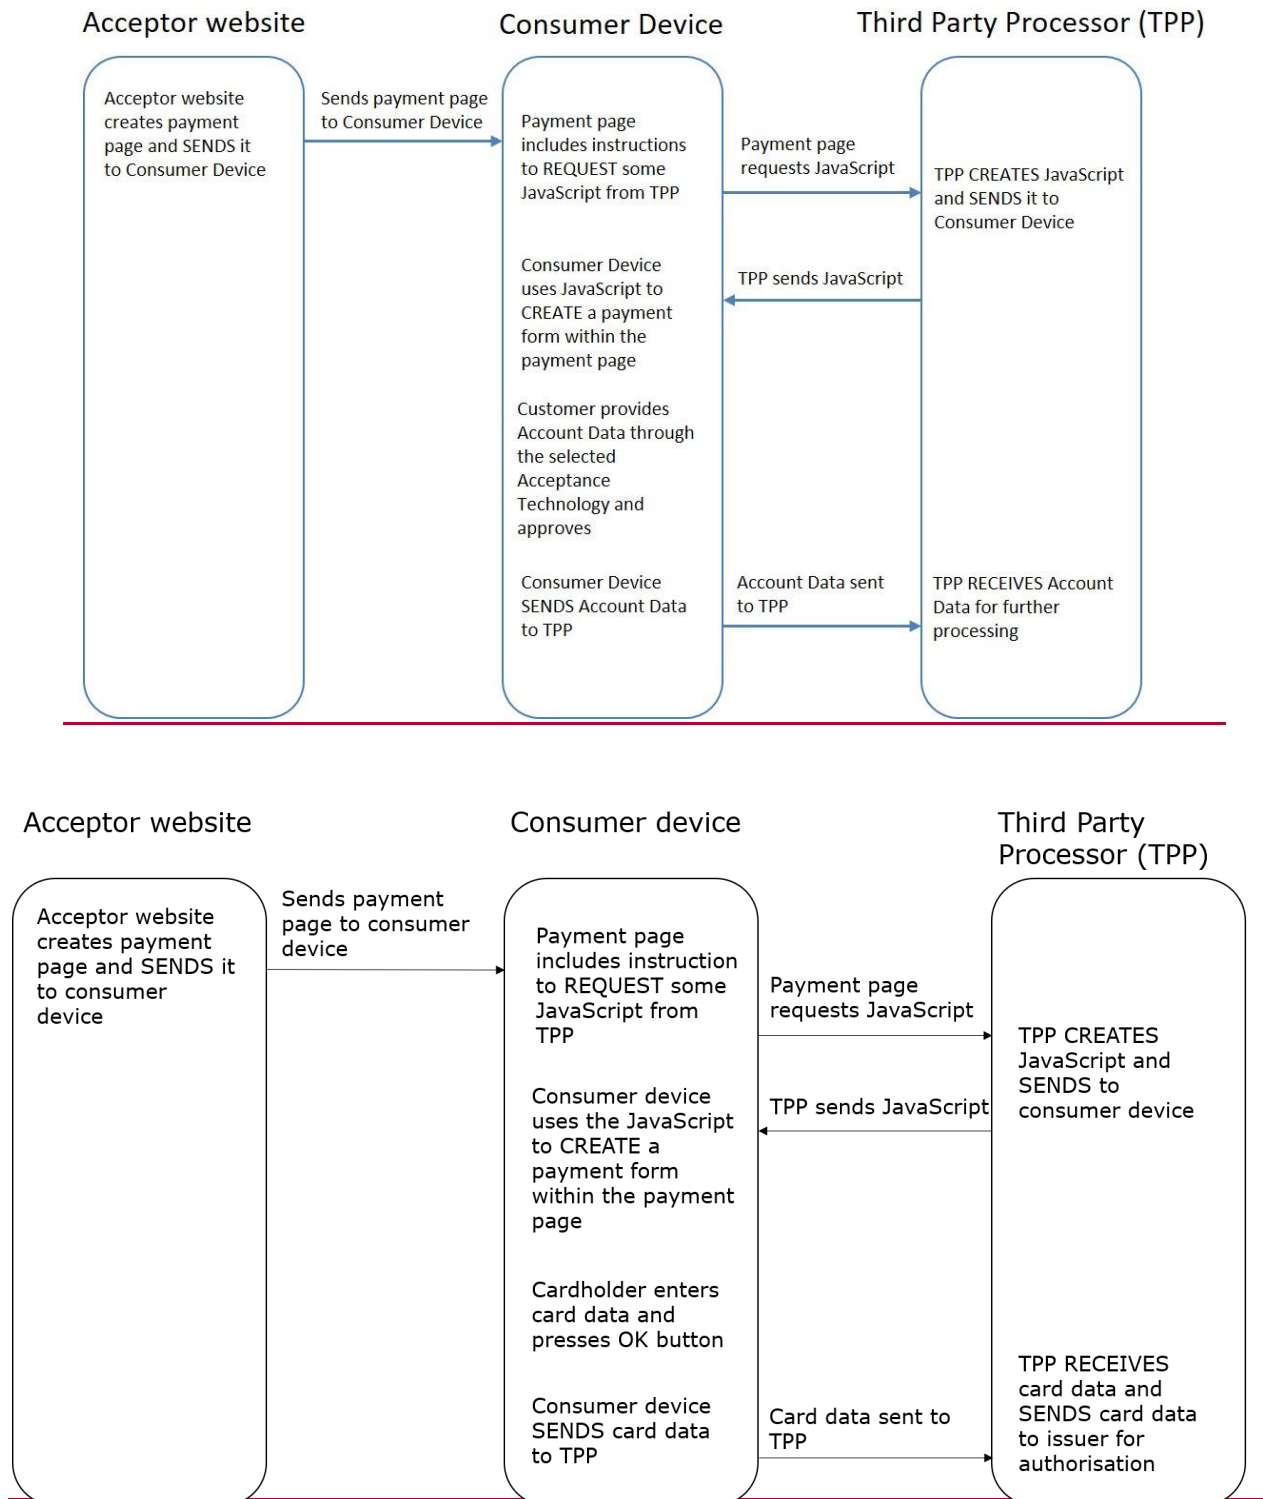

FIGURE 24: JAVASCRIPT CREATED FORM

3.3.5.3.5.5. The API

The following figure illustrates the different steps involved in the configuration whereby a so-called acceptor gateway is sending data from the **A**acceptor to the TPP in a specific format (e.g., XML).

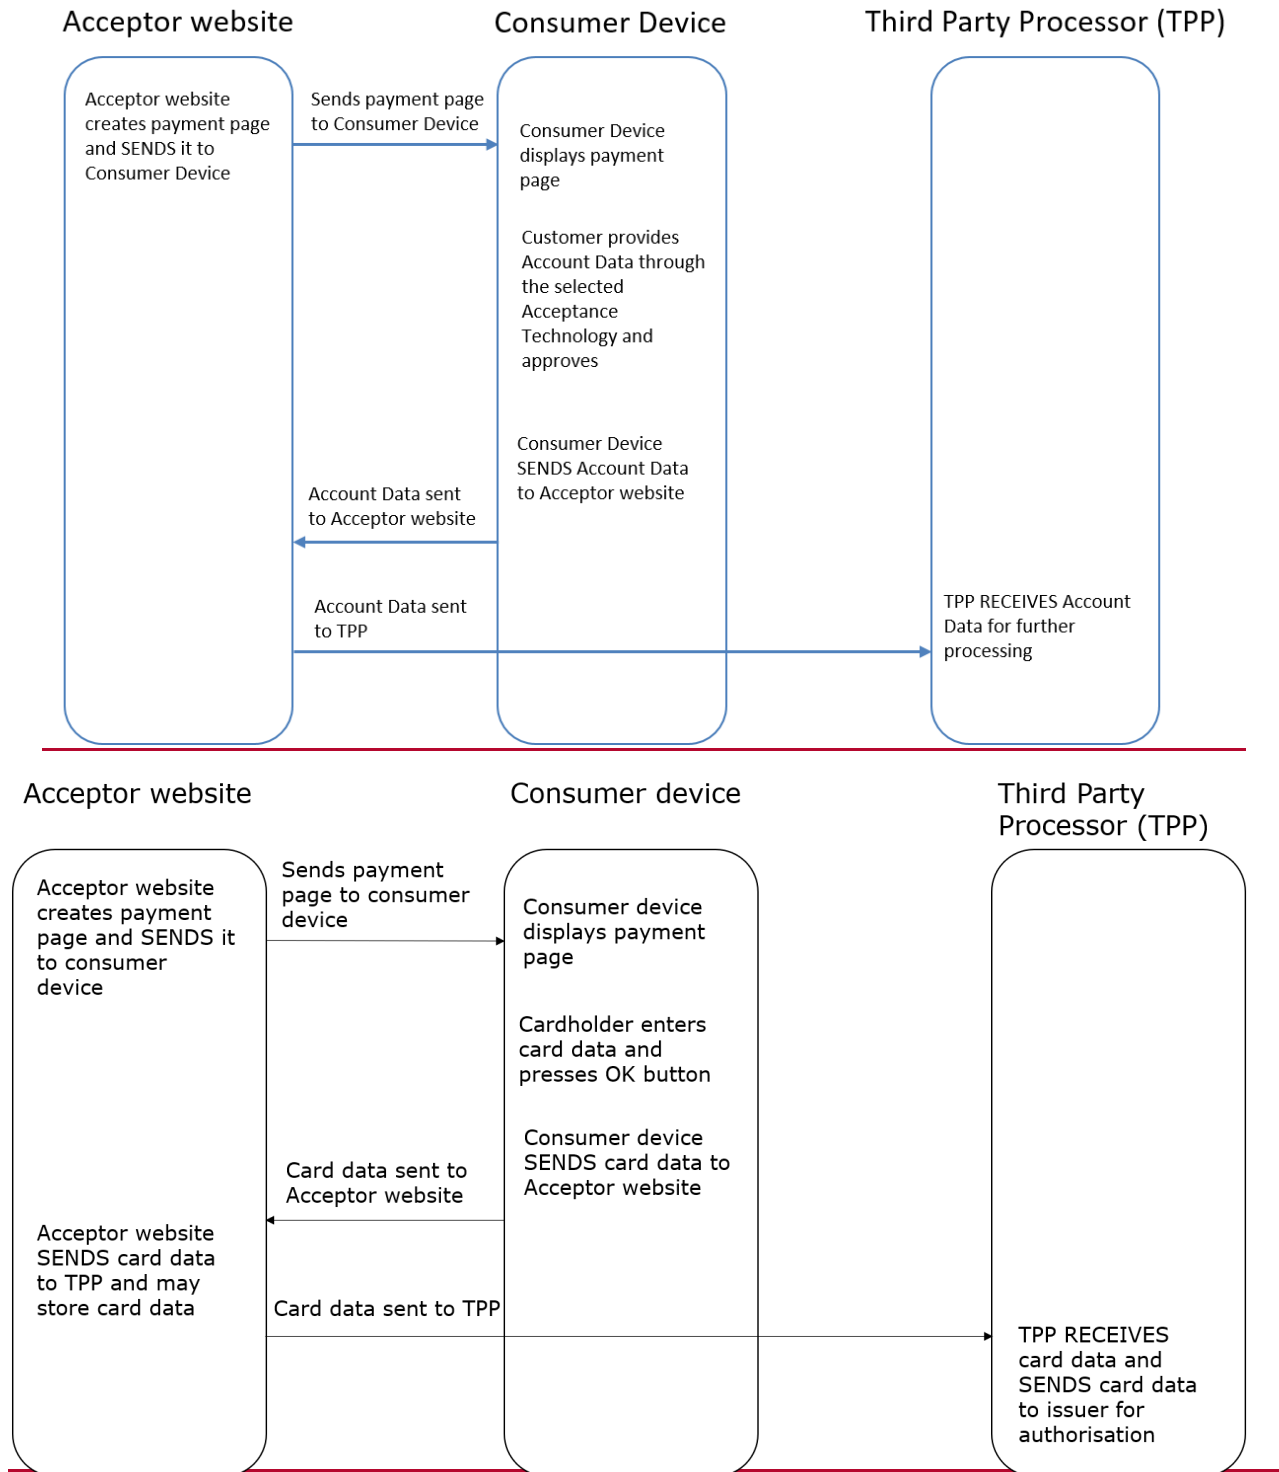

FIGURE 25: THE API

3.4.3.6. Stored Card Data and SRC in Virtual POI environments

3.4.1.3.6.1. Stored Card Data integration

With Stored Card Data, the Acceptors securely store Customer credentials for future use (i.e. future transactions initiated by the Customer, or MITs). This functionality may be used with all integration modes outlined in Section 3.5. However, the location of the Stored Card Data may differ depending on the chosen integration mode :

- Acceptor storage
- TPP storage
- Shared storage

3.4.1.1.3.6.1.1. Acceptor storage

In this approach, the Acceptor directly stores Card Data, resulting in greater control over the payment experience, but introducing significant impacts regarding management of compliance with PCI DSS requirements (including encryption of sensitive data, strict access controls and possibly tokenization). This approach is commonly used with API integration mode.

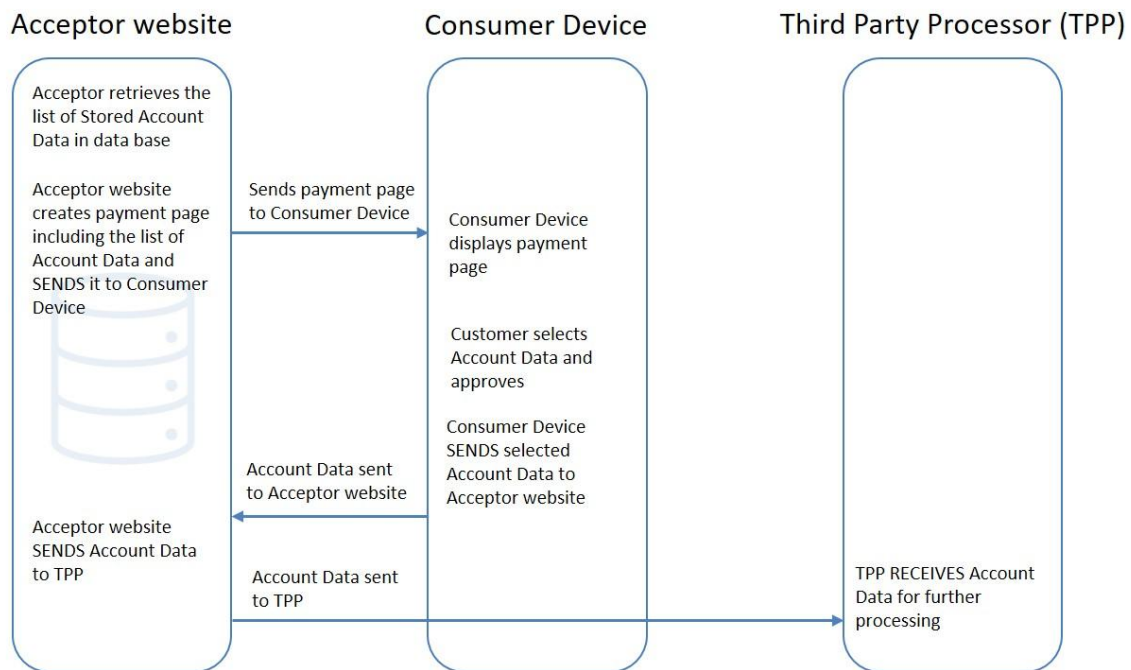

FIGURE 26: EXAMPLE OF ACCEPTOR STORAGE IN API INTEGRATION MODE

3.4.1.1.3.6.1.1. TPP storage

In this approach, the Acceptor entirely delegates Card Data storage to the TPP, minimizing its PCI DSS obligations. The TPP handles security responsibilities. This approach is commonly used with integration modes like iFrame and URL Redirection.

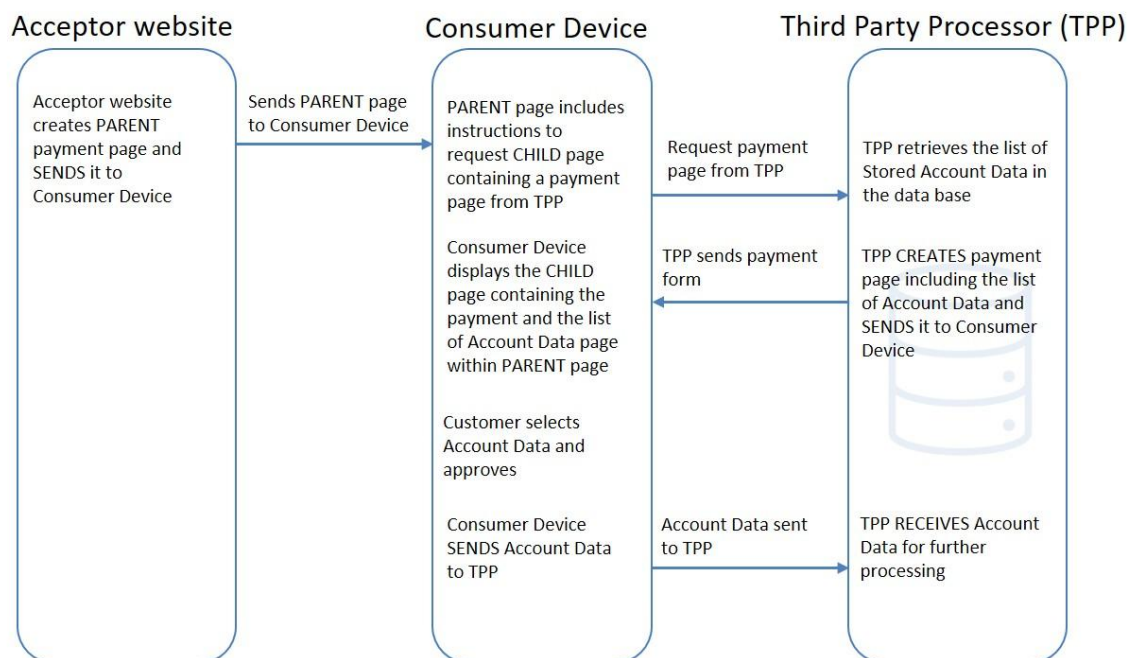

FIGURE 27: EXAMPLE OF TPP STORAGE IN IFRAME INTEGRATION MODE

3.4.1.2.3.6.1.2. Shared storage

In this approach, both the Acceptor and the TPP share responsibilities for Card Data storage. The TPP typically stores sensitive data and provide to the Acceptor non-sensitive references such as tokens or aliases to be stored. In addition, the Acceptor may store additional non-sensitive data to allow the Customer to identify the Card to be used (e.g. last four digits,...). This approach balances control and security for the Acceptor.

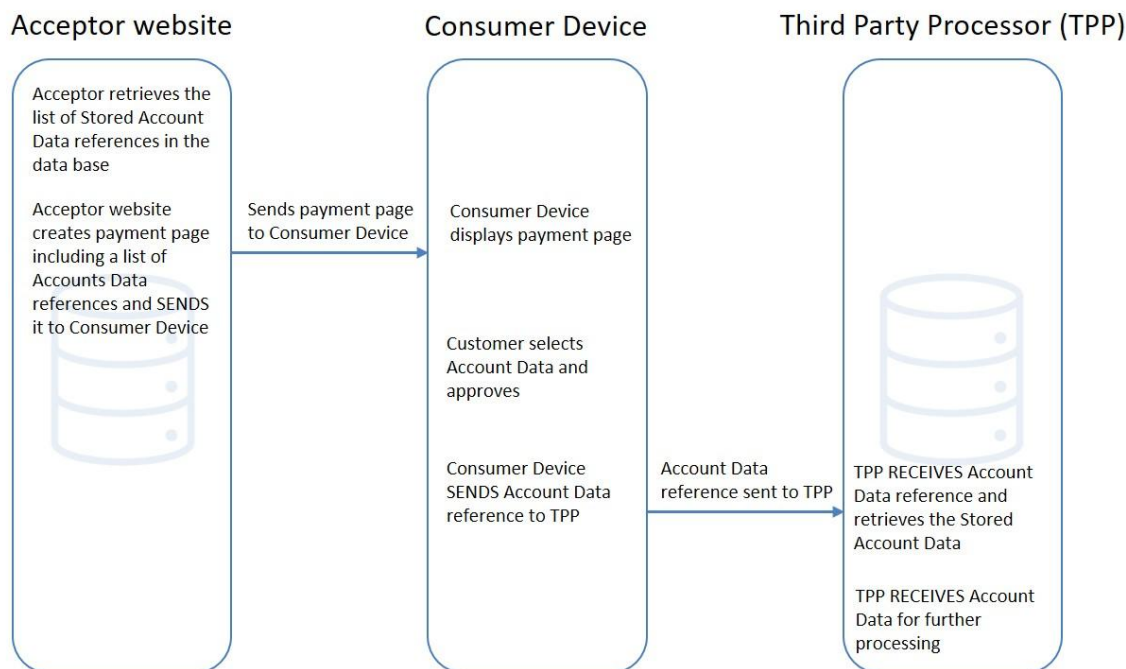

FIGURE 28: EXAMPLE OF SHARED STORAGE IN DIRECT POST INTEGRATION MODE

3.4.2.3.6.2. SRC-Specific Integration Considerations

SRC aims at minimising the number of times ~~Customers~~ Customers enter their ~~Card~~ Account Data. But unlike traditional models where ~~merchants~~ Acceptors store ~~Card~~ Account Data, SRC shifts data storage and management to SRC entities. This reduces the Acceptor's ~~PCI-DSS~~ security obligations ~~while enhancing security~~ shifting them to the SRC entities.

Key participants in SRC data storage:

- SRC System:- Stores SRC profiles, including Customer identity and related information.
- Digital Card Facilitator (DCF) : Primarily responsible for storing and providing Customer data such as billing/shipping addresses, and other details linked to a specific Customer identity.

SRC implementations ~~generally~~ may integrate with Payment Tokenization, ~~to enhance security by~~ replacing ~~the~~ PAN with a Payment Token. In this configuration, the SRC System acts as a Token Requestor to the Token Service Provider (TSP).

Note B: In the following flows, we consider that:

- ~~The~~ initiation and recognition phases are already performed and the ~~Consumer~~ Customer is recognized.
- ~~The~~ DPA is the entity enabling the initial interaction of a ~~Consumer~~ Customer with an Acceptor. It can be any payment-enabled application such as an Acceptor Website, or a ~~Payment A~~ application on the Consumer Device.
- The SRCI corresponds to the Third Party Processor (TPP).

- The ~~heard~~ headers in blue corresponds to the roles of the ~~as SRC-p~~ Participants in the SRC specifications.

~~3.4.2.1~~ 3.6.2.1. SRC Checkout

The following figure illustrates the standard SRC Checkout where the checkout process is orchestrated and facilitated by the SRC System.

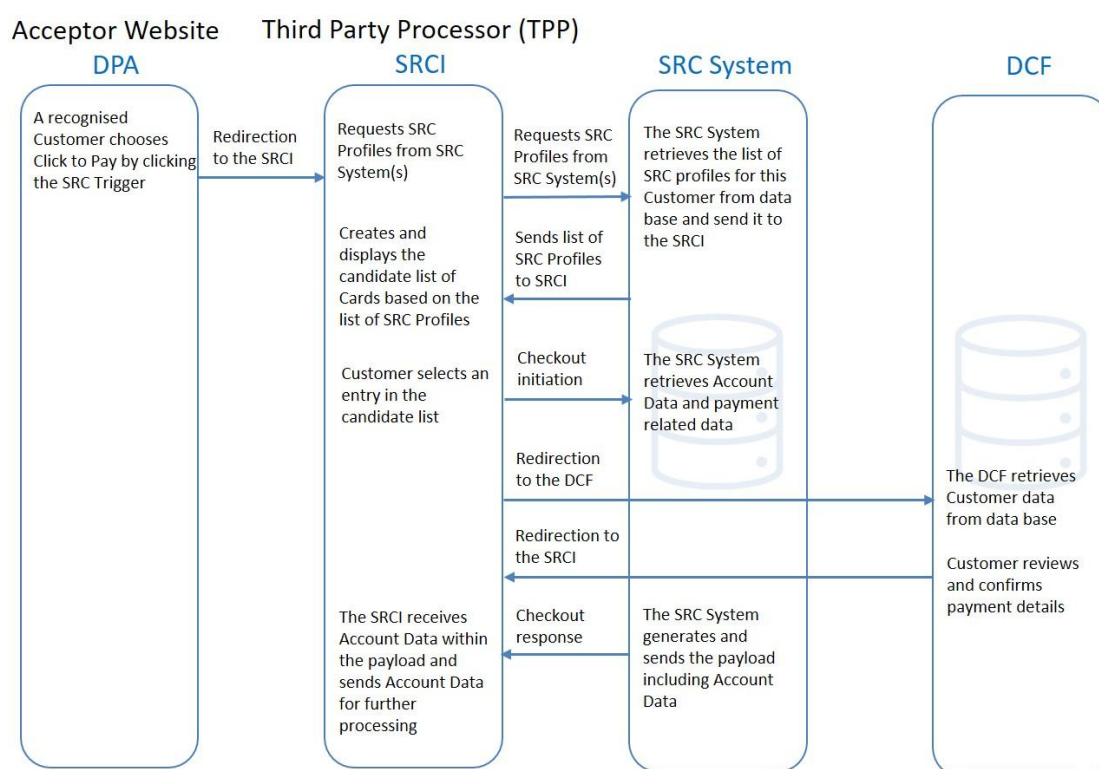

FIGURE 29: SRC CHECKOUT

~~3.4.2.2~~ 3.6.2.2. Merchant Checkout

In addition to the standard SRC Checkout illustrated above, the SRC specifications offer the flexibility to support alternative ~~merchant~~ Acceptor-driven checkout experiences (Merchant Checkout) where the ~~merchant~~ Acceptor takes on several roles by acting as both SRC Initiator (SRCI) and Digital Card Facilitator (DCF), in addition to the role of Digital Payment Application (DPA).

3.6.2.2.1. Merchant Orchestrated Checkout

The following figure illustrates the Merchant Orchestrated flow, where a purchase experience which is fully integrated within the merchants' current checkout, allowing them to control the user experience and manage recognition of Consumers. In this configuration, the Merchant Acceptro acts as DFC and is responsible for storing Customer data such as billing/shipping addresses.

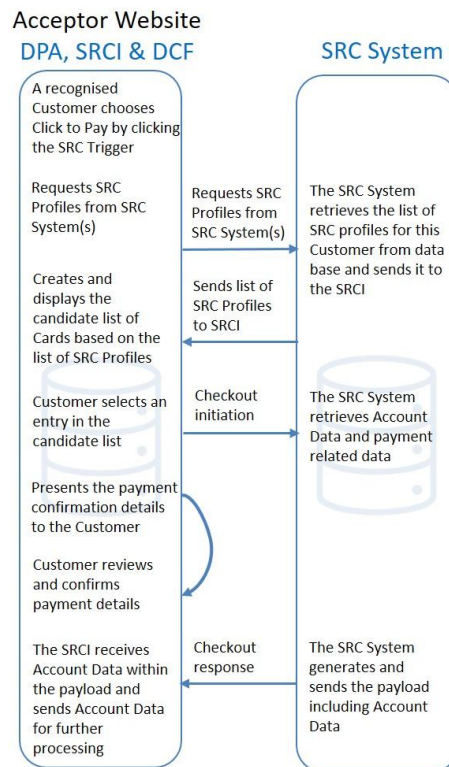

FIGURE 30: SRC MERCHANT ORCHESTRATED CHECKOUT

3.6.2.2.2. Merchant Digital Card On File Checkout

The following figure illustrates the Merchant Digital Card-On-File Checkout, where a purchase experience allows the Consumer Customer to designate a digital Card enrolled with a SRC System, which becomes their default digital Card stored by this specific Merchant Acceptro. Merchant Orchestrated flow, where a purchase experience is fully integrated within the merchants' current checkout, allowing them to control the user experience and manage recognition of Consumers. In this configuration, the Merchant acts as DFC and is responsible for storing Customer data such as billing/shipping addresses. In this configuration, the Merchant Acceptro also stores the data Account Data information from the designated digital Card and invokes the SRC System to obtain the payload for the transaction.

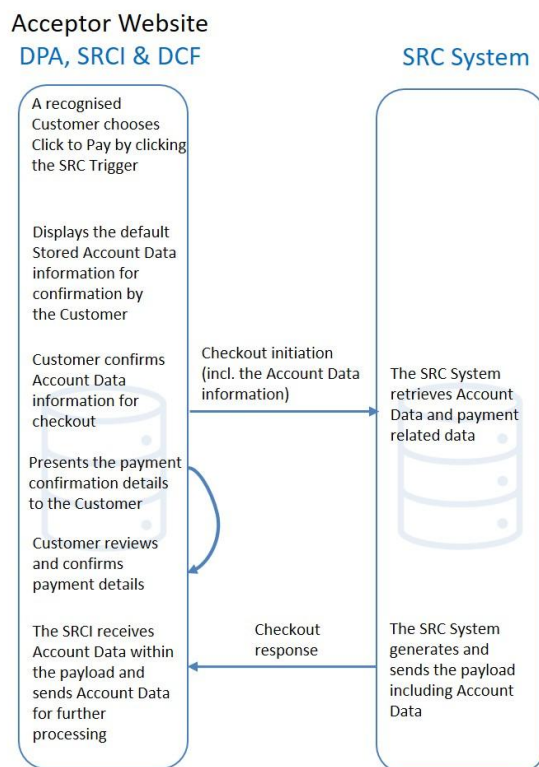

FIGURE 31: MERCHANT DIGITAL CARD-ON-FILE SRC CHECKOUT

4. ~~IMPLEMENTATION GUIDELINES~~ **BEST PRACTICES FOR IMPLEMENTATION PER PAYMENT CONTEXT**

This section provides guideline for implementation for each payment context (Local and Remote), including functional and security aspects required by Books 2 and 4 of this Volume. For detailed requirements, please refer directly to these Books.

4.1. Local Transaction

4.1. —

4.1.1. Chip with Contact

4.1.1.1. *One-off Payment*

4.1.1.1.1. *Definition of the payment context*

The POI is a Physical POI which could be standalone or integrated with the sales system. For unattended the POI is always integrated with the sales system.

For contact chip transactions SCA is required with exemptions as described in PSD2, e.g. for unattended POI used for Transport and Parking.

The following table describes the characteristics of this context from an Acceptance perspective:

Characteristics of the context	Attended	Unattended	
	with Cardholder Verification	with Cardholder Verification	without Cardholder Verification
Acceptance Technology	Chip Contact shall be supported as a minimum by the Physical POI		
Card and Cardholder present	Y		
Final amount known	Y		
Authorisation	Authorisation may either be online or offline The Physical POI shall either be offline with online capability or online only		
Data Capture	All 3 modes defined in section 3.40 are applicable		
Attendant Present	Y	N	
EMV Online Card Authentication-	Required		

Characteristics of the context	Attended	Unattended	
	with Cardholder Verification	with Cardholder Verification	without Cardholder Verification
EMV Offline Card Authentication	SDA optional from 2020⁵ <u>not supported</u> Offline with Online capability POI: DDA and CDA required Online only POI: DDA optional and CDA optional (recommended) ⚠		
Cardholder Verification Method	PIN mandatory	PIN mandatory	"No CVM Required" mandatory

Table 32: Local Transaction Contact Payment - Acceptance Characteristics

⁵ ~~SDA is still required by some non SEPA general purpose Card schemes.~~

The following table describes the characteristics of this context from an Issuance perspective:

Characteristics of the context	with Cardholder Verification	without Cardholder Verification
Acceptance Technology	Chip Contact shall be supported as a minimum by the Card Application	
Authorisation	The Card Application shall support Online Authorisation and in addition may support Offline Authorisation	
Card Authentication	SDA not permitted For all newly issued and replacement Cards <u>SDA not permitted</u> <u>DDA optional</u> <u>CDA mandatory</u> <u>XDA mandatory if ECC is supported</u> DDA and CDA and/or XDA required for all newly issued and replacement Cards	
Cardholder Verification Method	PIN mandatory	"No CVM Required" mandatory ⁶

Table 33: Local Transaction Contact Payment - Issuance Characteristics

~~4.1.1.1.2.~~ Card Services

~~For attended environment:~~

Service	Issuers	Schemes	Acquirers	Acceptors
Payment	Required	Required	Required	Required
Cancellation	Required	Required	Required	Optional

⁶ For Cards that do not support "No CVM Required", Issuers may receive an authorisation message containing "Cardholder Verification was not successful". It is up to the issuer to authorise or decline this message.

Refund	Required	Required	Required	Optional
---------------	-----------------	-----------------	-----------------	-----------------

~~Table 2730: Card Services—Volume Conformant IMPLEMENTATIONS FOR ATTENDED~~

~~For unattended environment:~~

Service	Issuers	Schemes	Acquirers	Acceptors
Payment	Required	Required	Required	Required

~~Table 2831: CARD SERVICES—VOLUME CONFORMANT IMPLEMENTATIONS FOR UNATTENDED~~

~~4.1.1.1.3-4.1.1.1.2.~~ Example of Message Flows

~~4.1.1.1.3-1-4.1.1.1.2.1.~~ Example of Message Flow - Attended with PIN

Two sample message flows are described below as examples of common implementations. In the Capture by Batch diagram, the data is shown as stored in the POI. This is for illustration purposes only. The physical location of the stored data is an implementation option of the Acceptor and may be different from the location of the POI.

Payment in attended environment, Cardholder is present, Cardholder Verification performed and final amount known. Capture immediately after Transaction Completion.

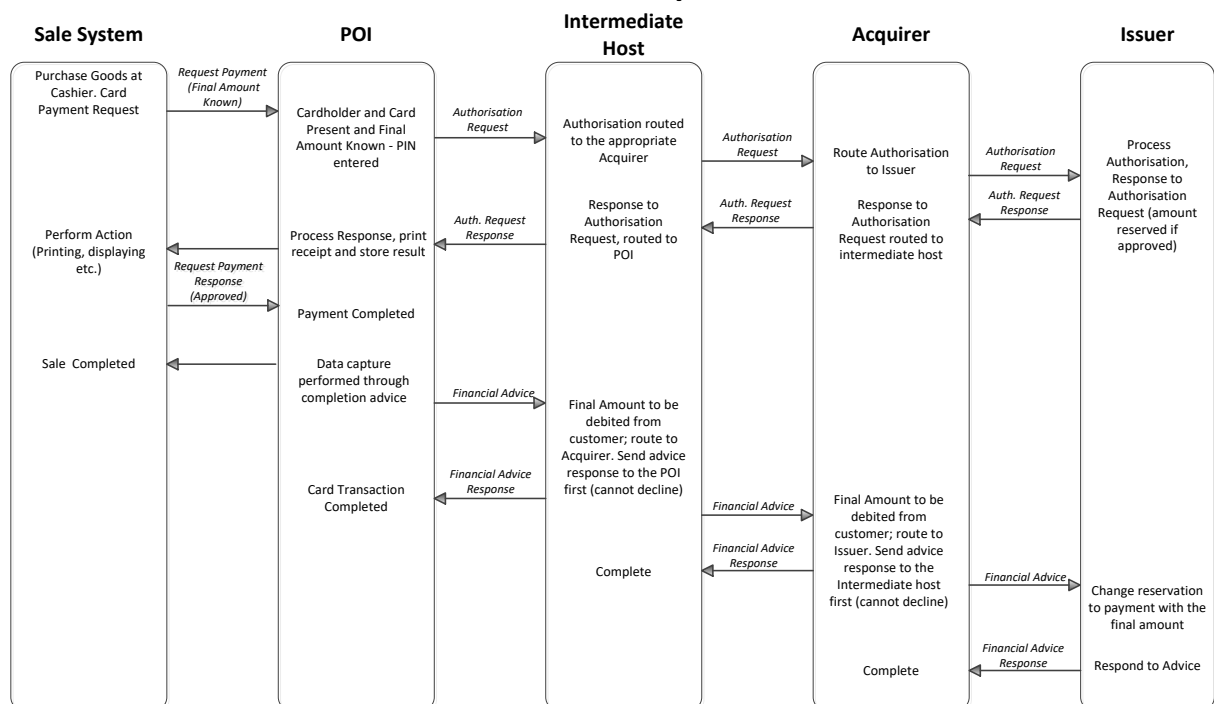

FIGURE 34: EXAMPLE FLOW: PAYMENT IN ATTENDED ENVIRONMENT, CARDHOLDER IS PRESENT, CARDHOLDER VERIFICATION PERFORMED AND FINAL AMOUNT KNOWN. CAPTURE IMMEDIATELY AFTER TRANSACTION COMPLETION

Payment in attended environment, Cardholder is present, Cardholder Verification performed and final amount known. Capture by Batch.

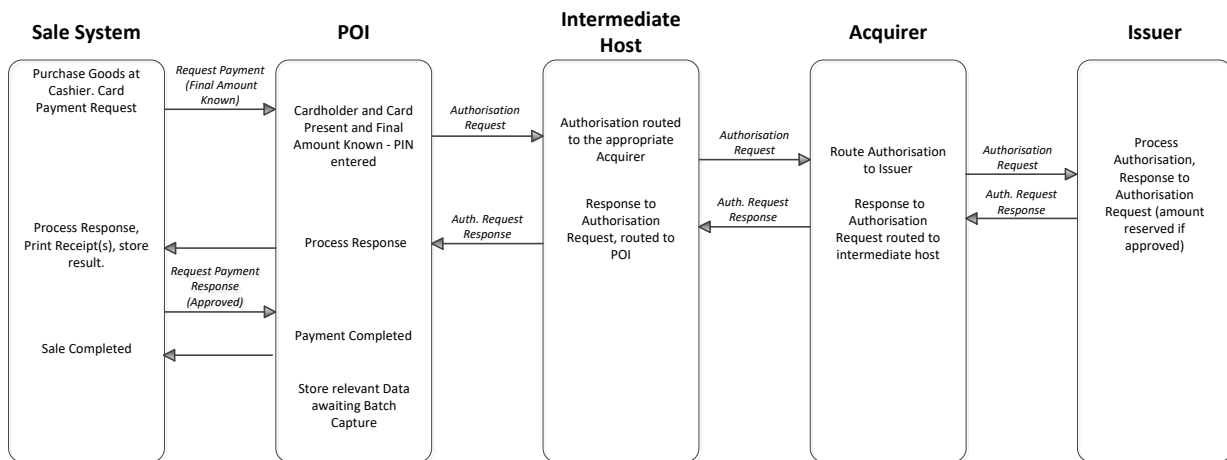

FIGURE 35: EXAMPLE FLOW: PAYMENT IN ATTENDED ENVIRONMENT, CARDHOLDER IS PRESENT, CARDHOLDER VERIFICATION PERFORMED AND FINAL AMOUNT KNOWN. CAPTURE BY BATCH.

4.1.1.1.3.2.4.1.1.1.2.2. Example of Message Flow - Unattended with PIN

Two sample message flows are described below as examples of common implementations. In the Capture by Batch diagram, the data is shown as stored in the POI. This is for illustration purposes only. The physical location of the stored data is an implementation option of the Acceptor and may be different from the location of the POI.

Payment in unattended environment, Cardholder is present, Cardholder Verification performed and final amount known. Capture immediately after transaction completion.

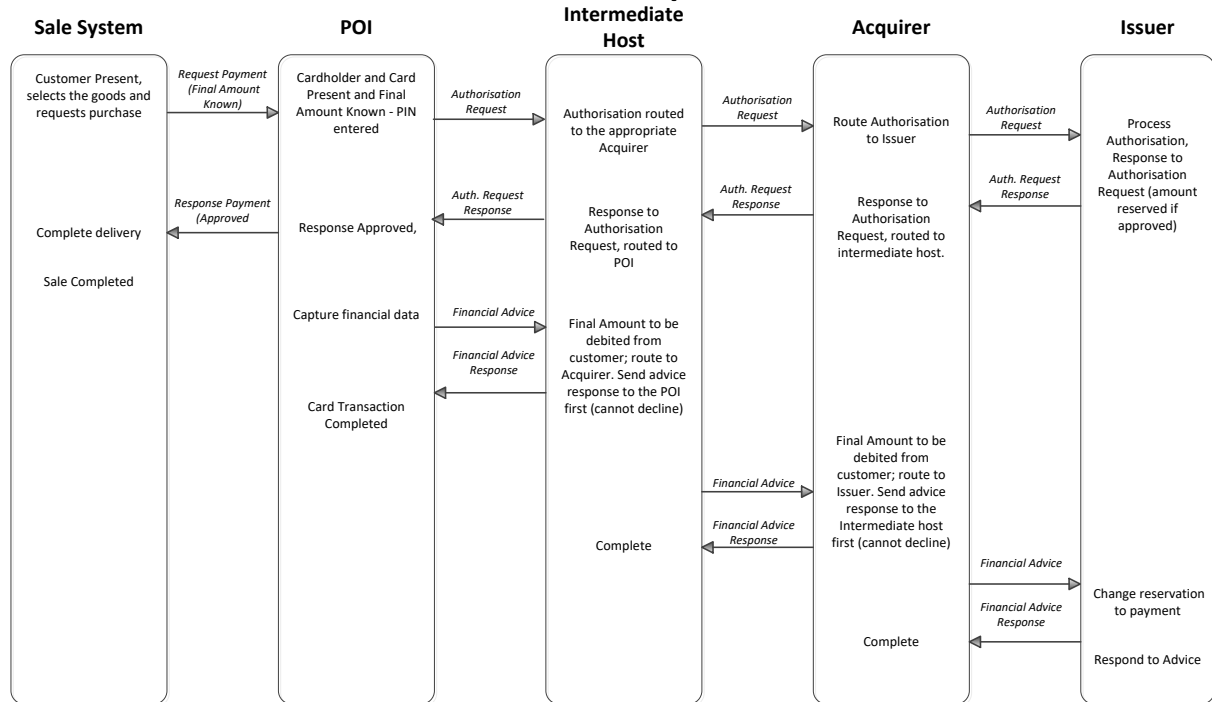

Figure 36: EXAMPLE FLOW: PAYMENT IN UNATTENDED ENVIRONMENT, CARDHOLDER IS PRESENT, CARDHOLDER VERIFICATION PERFORMED AND FINAL AMOUNT KNOWN. CAPTURE IMMEDIATELY AFTER TRANSACTION COMPLETION

Payment in unattended environment, Cardholder is present, Cardholder Verification performed and final amount known, Capture by Batch

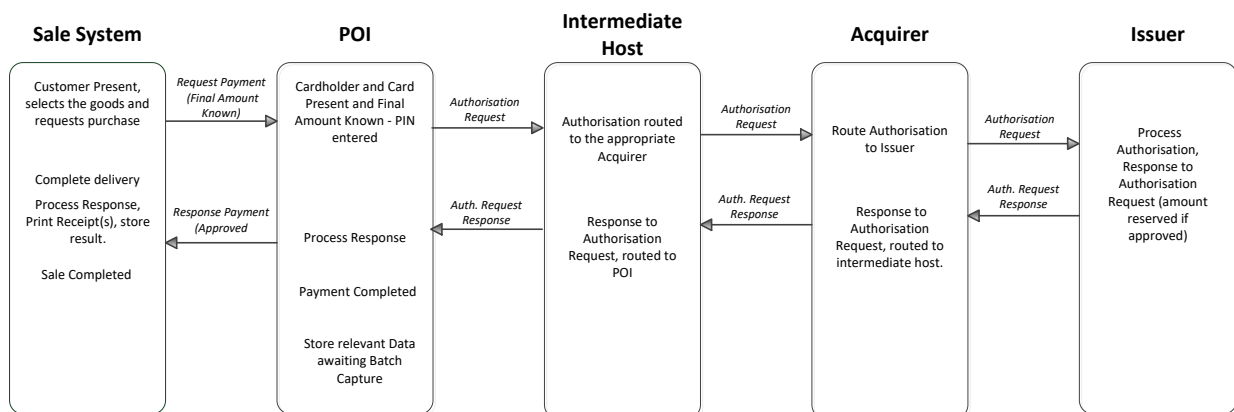

Figure 37: EXAMPLE FLOW: PAYMENT IN UNATTENDED ENVIRONMENT, CARDHOLDER IS PRESENT, CARDHOLDER VERIFICATION PERFORMED AND FINAL AMOUNT KNOWN, CAPTURE BY BATCH

4.1.1.1.3.3.4.1.1.1.2.3. Example of Message Flow - Unattended with “No CVM Required”

Two sample message flows are described below as examples of common implementations. In the Capture by Batch diagram, the data is shown as stored in the POI. This is for illustration purposes only. The physical location of the stored data is an implementation option of the Acceptor and may be different from the location of the POI.

Payment with ‘No CVM Required’ in unattended environment, Cardholder present and final amount known. Capture immediately after Transaction Completion

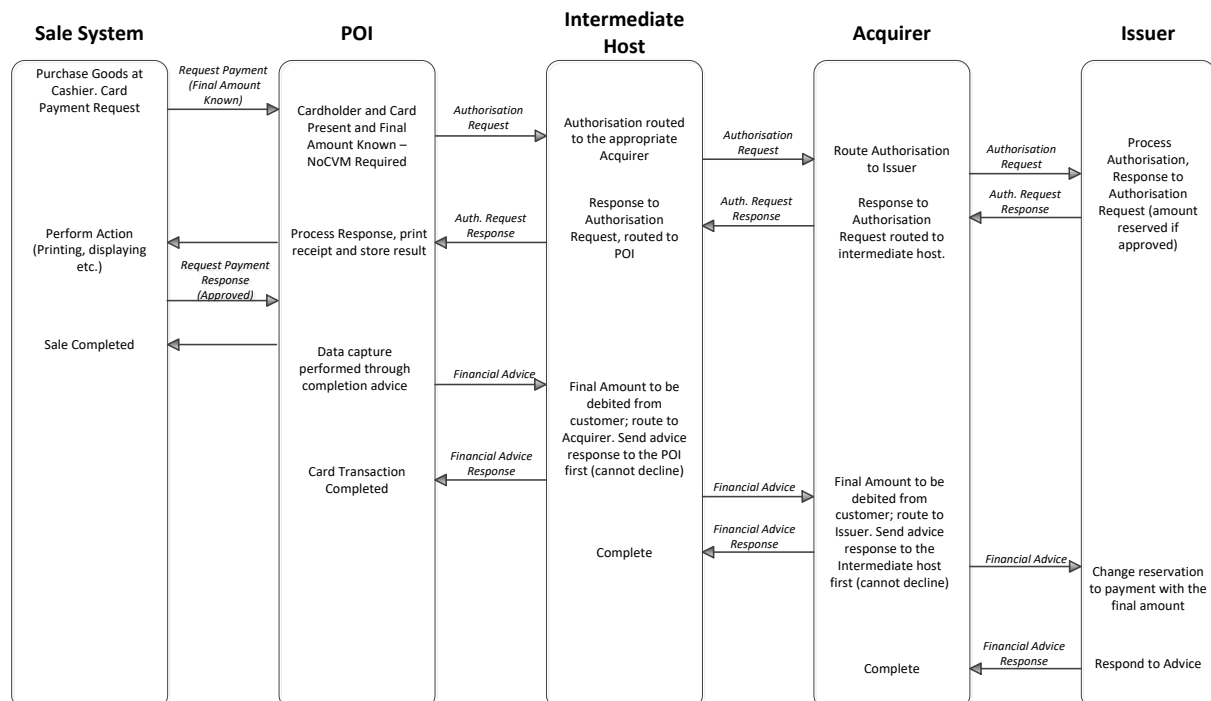

Figure 38: EXAMPLE FLOW: PAYMENT WITH ‘NO CVM REQUIRED’ IN UNATTENDED ENVIRONMENT, CARDHOLDER PRESENT AND FINAL AMOUNT KNOWN. CAPTURE IMMEDIATELY AFTER TRANSACTION COMPLETION.

Payment with 'No CVM Required' in attended or unattended environment, Cardholder present and final amount known. Capture by Batch.

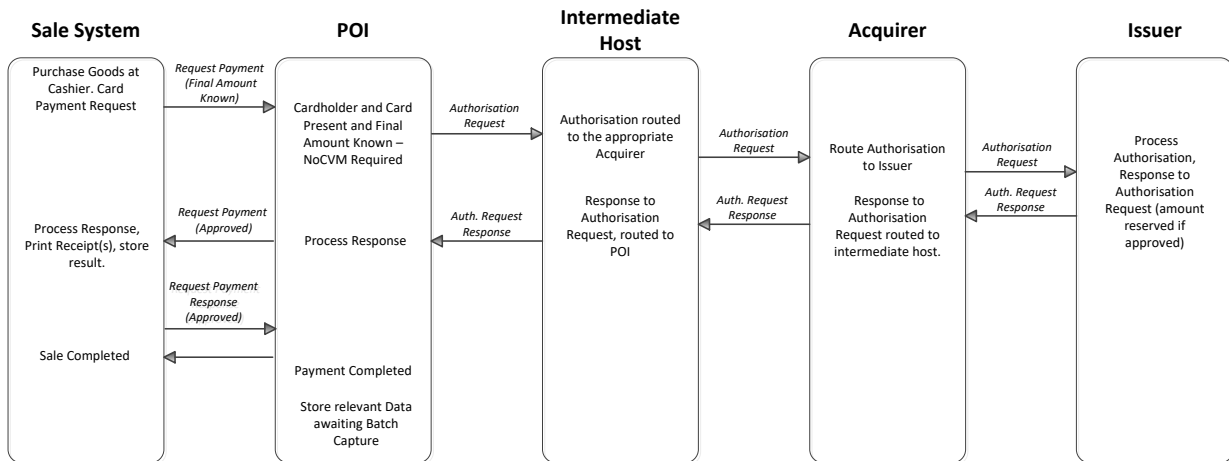

Figure 39: EXAMPLE FLOW: PAYMENT WITH 'NO CVM REQUIRED' IN ATTENDED OR UNATTENDED ENVIRONMENT, CARDHOLDER PRESENT AND FINAL AMOUNT KNOWN. CAPTURE BY BATCH.

4.1.1.2. Deferred Payment

4.1.1.2.1. Definition of the payment context

This context is used in environments where the final amount to be paid for the goods or services is not known by the acceptor at the time online authorisation is performed. The final amount is known on completion of delivery.

The POI is a Physical POI which could be standalone or integrated with the sales system. For unattended the POI is always integrated with the sales system.

The following table describes the characteristics of this context from an Acceptance perspective:

Characteristics of the context	Attended	Unattended	
	with Cardholder Verification	with Cardholder Verification	without Cardholder Verification
Acceptance Technology	Chip Contact shall be supported as a minimum by the Physical POI		
Card and Cardholder present	Y		
Final amount known	N (at the time of authorisation)		
Authorisation	Authorisation shall always be online Partial approval shall be supported by Acquirers and Acceptors The Physical POI shall either be online only or offline with online capability		
Data Capture	Modes 1 and 2 as defined in section 0 are applicable ⁷		
Attendant Present	Y	N	
EMV Online Authentication.	Required		
EMV Offline Card Authentication	SDA optional from 2020 ⁸ Offline with Online capability POI: DDA and CDA required Online only POI: DDA optional and CDA optional (recommended)		
Cardholder Verification Method	PIN required	PIN required	“No CVM Required” required

Table 40: Local Transaction Deferred Payment - Acceptance Characteristics

⁷ Mode 3 is not applicable as, at the time of Authorisation, the final amount is not known.

⁸ SDA is still required by some non SEPA general purpose Card schemes

The characteristics of this context from an Issuance perspective are the same as described for payment, see table 4:

The flow described below will provide all necessary information to the issuer allowing them to adjust any reserved amount with the final amount, thereby avoiding Cardholder complaints.

This service enables the acceptor to:

- Request an authorisation from the issuer to get a maximum amount available for the transaction where the amount requested may be chosen by the acceptor or Cardholder;
- Obtain a full approval, or a partial approval when the Cardholder has insufficient funds for the amount requested;
- Complete the delivery of goods or use of service to be paid up to the approved amount within a limited time frame (e.g., 20 minutes for petrol);
- Inform the issuer of the payment of these goods or services with the final amount that is less than or equal to the authorised amount in real time.

This service is usually used at petrol stations, attended and unattended. The following rules apply:

- 1) The amount that is requested to be authorised online is the maximum amount that may be required;
- 2) In order to avoid transactions being unnecessarily declined, Issuers shall support partial approval in responses when the “Cardholder Available Funds” is lower than the amount requested;
- 3) All parties in the protocol chain shall forward and/or act on ~~on-line~~online advice messages (or reversal), including zero amounts, so that the Cardholder Available Funds shall be adjusted in real time. If additional messages (e.g., batch clearing messages) are received, they shall be correctly handled”.

~~4.1.1.2.2. Card Services~~

~~For attended and unattended environments:~~

Service	Issuers	Schemes	Acquirers	Acceptors
Deferred Payment	Required			
Deferred Payment with Partial Approval	Required	Required	Required	Required

~~Table 3639: PAYMENT SERVICES – VOLUME CONFORMANT IMPLEMENTATION~~

4.1.1.2.3.4.1.1.2.2. Example of Message Flows

Two sample message flows are described below as examples of common implementations. In the Capture by Batch diagram, the data is shown as stored in the POI. This is for illustration purposes only. The physical location of the stored data is an implementation option of the Acceptor and may be different from the location of the POI.

Deferred Payment Card Message Flow. Capture immediately after Transaction Completion, using the financial advice

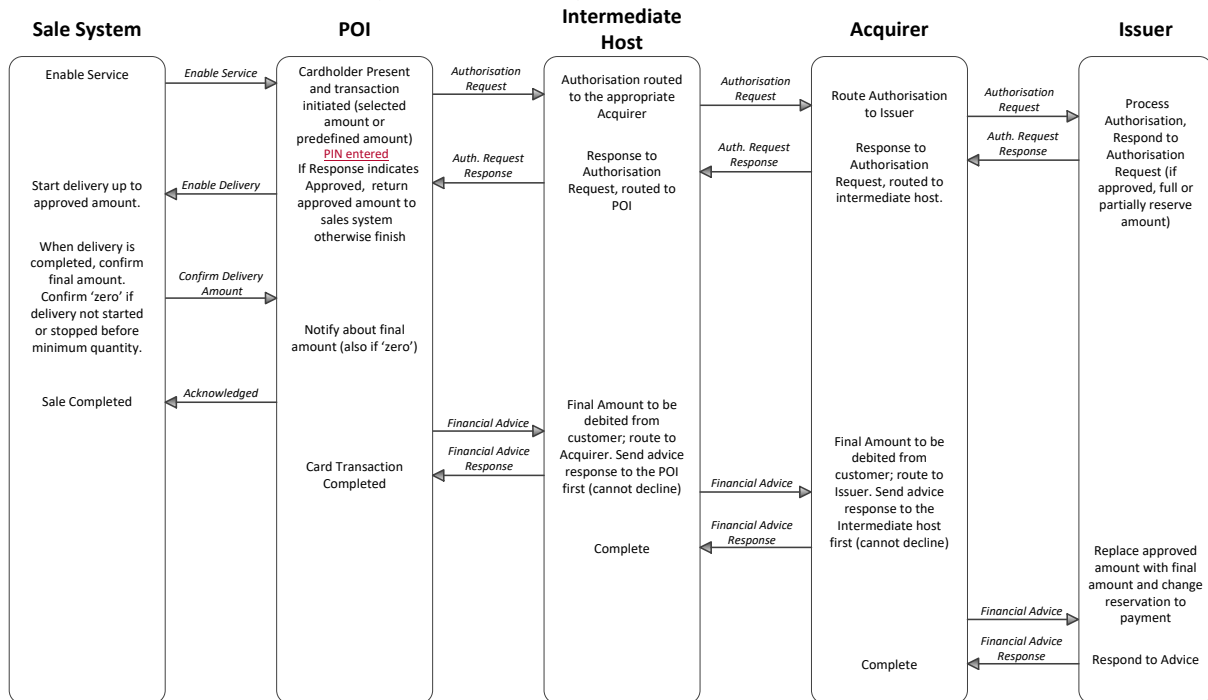

FIGURE 41: EXAMPLE FLOW: DEFERRED PAYMENT CARD MESSAGE FLOW, CAPTURE IMMEDIATELY AFTER TRANSACTION COMPLETION

Deferred Payment Card Message Flow, Capture by Batch.

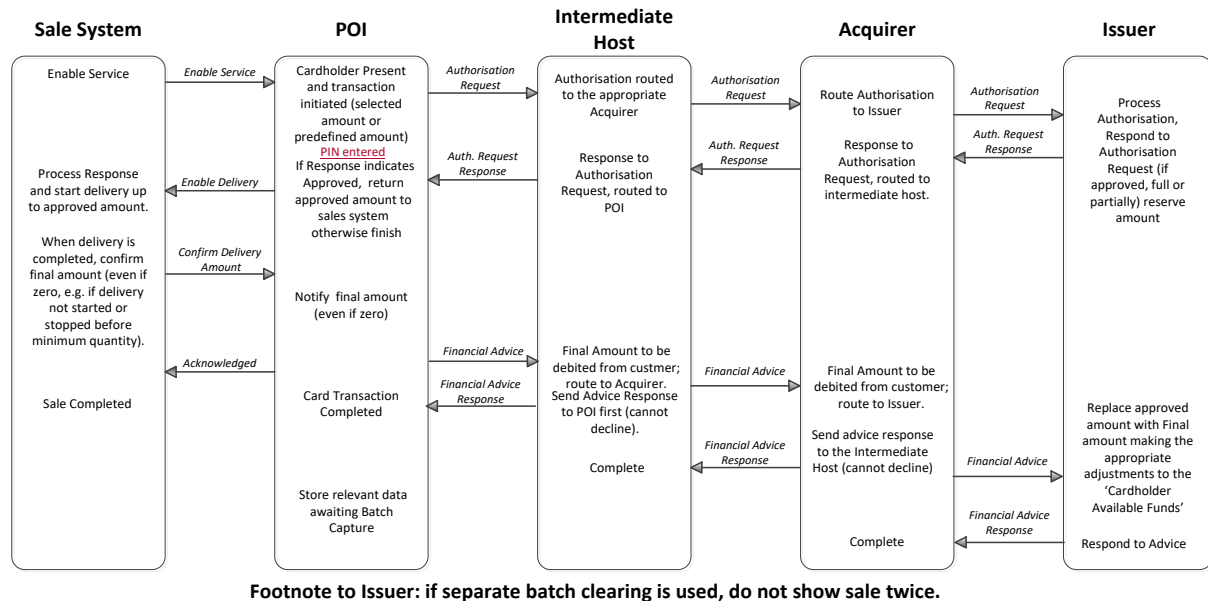

FIGURE 42: EXAMPLE FLOW: DEFERRED PAYMENT CARD MESSAGE FLOW, CAPTURE BY BATCH

4.1.1.3. Pre-Authorisation Services

4.1.1.3.1. Definition of the payment context

This payment context is used in an environment where the final amount is not known but a guarantee of payment is required for the Acceptor. This context allows:

- The Acceptor to reserve an estimated amount until the final amount is known.
- The Issuer to more efficiently manage the Cardholder Available Funds in real-time, by either reserving or releasing funds.

A Pre-Authorisation Service is used to reserve the funds for an estimated amount. Thereafter, the estimated amount can be increased or decreased using an Update Pre-Authorisation Service. A Payment Completion Service is used to finalise the transaction when the final amount is known.

In the event that the amount pre-authorized is not used, the previously authorised amount(s) must be released by the Cancellation Service. In this case Payment Completion shall not follow.

This context is mostly used for e.g., hotels and car hire, etc.

In most cases the same Card is used for Pre-Authorisation and Payment Completion. However, if a different Card is used for Payment Completion, then any amounts authorised on the other Card(s) used for Pre-Authorisation shall be removed using the Cancellation Service.

The POI is a Physical POI which could either be a standalone device or a device integrated with the point of sale. For unattended the POI is always integrated into the Sales system.

The Pre-Authorisation services may either be performed as Card Present or Card Not Present transactions.

The following table describes the characteristics of this context from an Acceptance perspective:

Characteristics of the context	Attended	Unattended
Acceptance Technology	Chip Contact shall be supported as a minimum by the Physical POI	
Card and Cardholder present	Y/N	
Final amount known	N	
Authorisation	Authorisation shall be online. The Physical POI shall either be offline with online capability or online only	
Data Capture	NA	
Attendant Present	Y	N
EMV Online Card Authentication.	Required	
EMV Offline Card Authentication	SDA optional from 2020 ⁹ Offline with Online capability POI: DDA and CDA required Online only POI: DDA and CDA optional (recommended)	
Cardholder Verification Method	PIN Mandatory	PIN Mandatory

Table 43: Local Transaction Pre-Authorisation and Update Pre-Authorisation Service - Acceptance Characteristics

⁹ SDA is still required by some non SEPA general purpose Card schemes.

Characteristics of the context	Attended	Unattended
Acceptance Technology	Chip Contact shall be supported as a minimum by the Physical POI	
Card and Cardholder present	Y/N	
Final amount known	Y	
Authorisation	NA for payment completion	
Data Capture	Modes 1 and 2 as defined in section 0 are applicable ¹⁰	
Attendant Present	Y	N
EMV Online Card Authentication.	NA for payment completion	
EMV Offline Card Authentication	NA for payment completion	
Cardholder Verification Method	NA for payment completion	

Table 44: Local Transaction Payment Completion Service - Acceptance Characteristics

The characteristics of this context from an Issuance perspective are the same as described for payment, see table 11:

Card Services

The Pre authorisation Services will consist of two or more of the following steps:

- A Pre-Authorisation to reserve funds when the final amount is not known;
- Update Pre-Authorisation(s)¹¹ to increase or decrease the pre-authorised amount if, prior to completion, the pre-authorised amount;
 - Is insufficient to cover the estimated final amount.
 - Is more than that required to cover the estimated final amount, to reduce the reserved amount(s) including, if necessary, to zero.
 - ~~○ Exceeds the configured overspend percentage amount allowed by some scheme rules.~~

- Payment completion for an equal or lesser amount than the amount previously Authorised when the final amount is known ~~or for a greater amount provided it is within the configured overspend percentage amount allowed by the appropriate scheme rules~~

Or

- As soon as it is known that a Pre-Authorisation and any Update Pre-Authorisations linked to it will not be used, the previously authorised amount(s) must be released by a Cancellation, that cancels the Pre-Authorisation and any Update Pre-Authorisation linked to it.

In this case Payment Completion shall not occur.

As the Pre-Authorisation service consists of two or more steps, they are linked together using a unique identifier (UID). This UID is included in the Pre-Authorisation response message and reused in subsequent transactions.

An update Pre-Authorisation cannot occur after a payment completion.

Issuers shall adjust the 'Cardholder Available Funds' in real time by acting upon Pre-Authorisation, update Pre-Authorisation(s), payment completion and cancellation.

Acceptors shall:

- Process a Pre-Authorisation or update Pre-Authorisation if the amount is estimated;
- Process an update-Pre-Authorisation if the estimated amount is greater or less than that originally authorised, alternatively the authorisation may be cancelled if the final amount is zero.
- Only process the payment completion equal to or less than the accumulated authorised amount(s). ~~The accumulated authorised amount(s) can only be exceeded by a configurable overspend percentage, if allowed by scheme rules.~~

¹⁰ If Authorisation is used for Payment Completion, Mode 3 may also be used for Data Capture.

¹¹ Multiple update Pre-Authorisation(s) may be used in this scenario.

The following ~~Card services~~ are supported for this context:

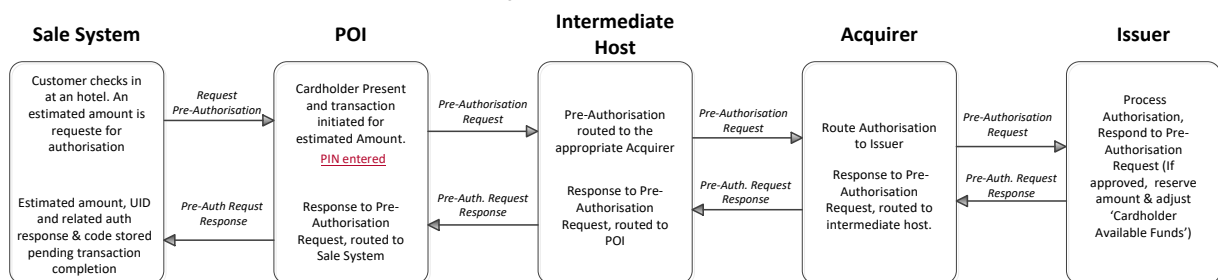

Service	Issuers	Schemes	Acquirers	Acceptors
Pre- Authorisation	Required 01/2021	Required 01/2021	Required 01/2021	Required 01/2021
Update Pre- Authorisation	Required 01/2021	Required 01/2021	Required 01/2021	Optional
Cancellation	Required 01/2021	Required 01/2021	Required 01/2021	Optional
Payment Completion	Required 01/2021	Required 01/2021	Required 01/2021	Required 01/2021

~~Table 44: CARD SERVICES – VOLUME CONFORMANT IMPLEMENTATIONS~~

4.1.1.3.2. Example of Message Flows

Four sample message flows are described below as examples of common implementations. In the Capture by Batch diagram, the data is shown as stored in the POI. This is for illustration purposes only. The physical location of the stored data is an implementation option of the Acceptor and may be different from the location of the POI.

Pre-Authorisation Services in an attended or unattended environment to reserve and secure an amount, cardholder present: Pre-Authorisation

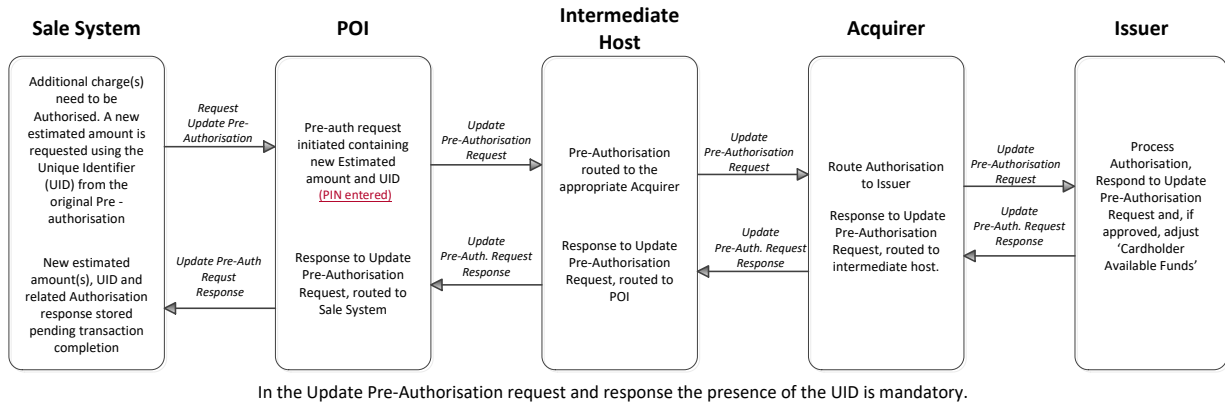

In the Pre-Authorisation request the presence of the UID is optional. In the pre-authorisation response the presence of UID is mandatory

No Data Capture

Figure 45: EXAMPLE FLOW: PRE-AUTHORISATION SERVICES IN AN ATTENDED OR UNATTENDED ENVIRONMENT TO RESERVE AND SECURE AN AMOUNT, CARDHOLDER PRESENT: PRE-AUTHORISATION

Pre-Authorisation Services in an attended or unattended environment to reserve an estimated amount: Update Pre-authorisation

No Data Capture

4.1.2. Chip and Mobile Contactless Payment

For Chip and Mobile Contactless only One-off Payment is described. The description ~~For Deferred Payment and Pre-Authorisation Services~~ based on Chip and Mobile Contactless can be derived accordingly from the respective descriptions as described in section 4.1.1, the differences from contact to contactless described in the following paragraph are applied in the same way.

4.1.2.

4.1.2.1. One-off Payment

4.1.2.1.4.1.2.1.1. Definition of the payment context

This payment context is used for contactless transactions initiated by a Physical Card or a Mobile Contactless Application on a Mobile Device.

The POI is a Physical POI which could be standalone or integrated with the sales system. For unattended the POI is always integrated with the sales system.

~~For Deferred Payment and Pre-Authorisation Services as described in section 4.1.1, the differences from contact to contactless described in the following paragraph are applied in the same way.~~

The following table describes the characteristics of this context from an Acceptance perspective:

Characteristics of the context	Attended	Unattended
Acceptance Technology	Chip or Mobile Contactless	
Card and Cardholder present	Y	
Final amount known	Y	
Authorisation	Authorisation may either be online or offline The Physical POI shall either be offline with online capability or online only However, it is recommended to be offline with online capability	
Data Capture	All 3 modes defined in section 3.40 are applicable	
Attendant Present	Y	N
EMV Online Card Authentication.	Required	
EMV Offline Card Authentication	Offline with Online capability POI: CDA or fDDA required Online only POI: CDA or fDDA required	
Cardholder Verification Method	Online PIN Offline Mobile Code CDCVM No CVM Required Signature ¹²	Online PIN CDCVM Offline Mobile Code No CVM Required

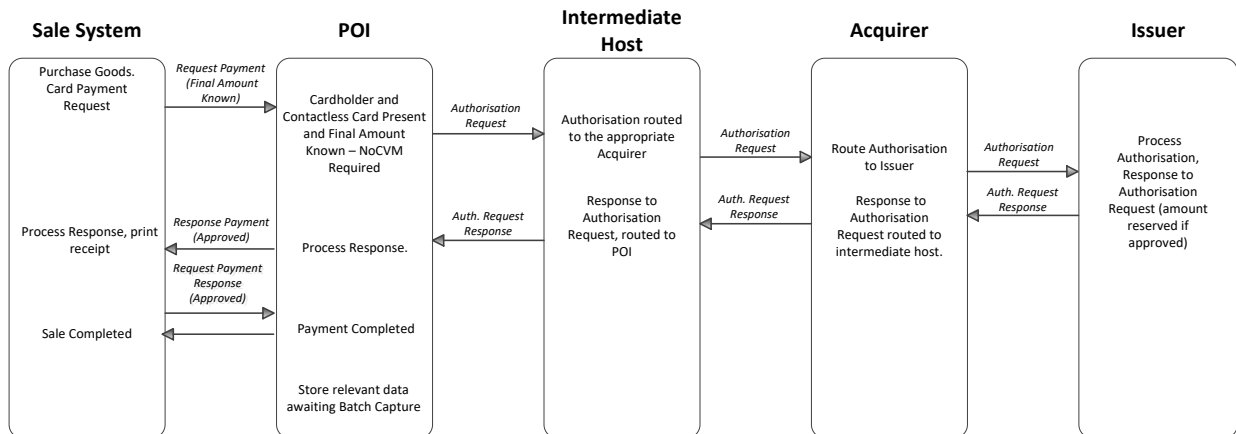

Figure 54: EXAMPLE FLOW: CONTACTLESS PAYMENT (ONLINE AUTHORISATION) WITH NO CARDHOLDER VERIFICATION METHOD REQUIRED IN AN ATTENDED AND UNATTENDED ENVIRONMENT, CARDHOLDER IS PRESENT AND FINAL AMOUNT KNOWN. CAPTURE BY BATCH

4.2. Remote Transactions

4.2.1. e-and m-Commerce **One-off Payment**

4.2.1.1. Definition of the payment context

The POI is a Virtual POI which supports a payment page to enter relevant payment related Card Data. This may be integrated with the Acceptor website or hosted externally on a payment gateway, typically hosted by a third party. The relevant payments ~~related~~ data is transferred from the payment page via the payment gateway to the Acquirer. The Virtual POI may also facilitate redirection services to support “direct” remote Authentication of the Cardholder-Customer by the Issuer via an authentication server.

The following table describes the characteristics of this context from an Acceptance perspective:

<u>Characteristics of the context</u>	<u>Virtual POI</u>	
Characteristics of the context	Virtual POI	
	with Cardholder Verification	without Cardholder Verification
Acceptance Technology	Manual Entry by Cardholder <u>Customer</u> Stored Card Account Data Payment Credentials on Consumer Device Payment Credentials on Consumer Device with Authentication Application <u>Browser over Internet</u> Consumer Device with (M)RP <u>Dedicated Application on over Internet Consumer Device</u>	
Physical Card or Consumer device present <u>Payment Device</u>	Remotely	
Final amount known	Y	
Authorisation	Authorisation may shall either be online or offline (if an (M)RP Application is present in the consumer device) The Virtual POI shall be online	
Data Capture	All 3 modes defined in section 3.4 0 are applicable	
Card Authentication	<u>Risk-Based Authentication to decide whether SCA is required or not (optional, but requires redirection to the Issuer domain)</u> Static Authentication for low risk payments (see [EBA]) <u>Risk-Based Authentication (optional, but requires redirection to the Issuer domain)</u> For SCA, at least two authentication factors of different types (possession, knowledge, inference) from the following list shall be used, in accordance with regulatory requirements: <u>For SCA, a possession factor and a knowledge or inference factor from the following list shall be used:</u> <ul style="list-style-type: none"> <u>Dynamic authentication</u> ¹³ <u>(Possession factor under SCA);</u> <u>Mobile Code (m-commerce) or Personal Code (e-commerce) (Knowledge factor under SCA)</u> <u>Biometrics via Sensor on Card or Biometrics on Consumer Device (Inference factor under SCA)</u> Redirection to the Card Issuer domain may occur	

<u>Characteristics of the context</u>	<u>Virtual POI</u>	
<u>Characteristics of the context</u>	<u>Virtual POI</u>	
	<u>with Cardholder Verification</u>	<u>without Cardholder Verification</u>
<u>Passive Risk-Based Authentication</u>	<u>Optional, but requires redirection to the Card issuer domain</u>	
<u>Cardholder Verification Method</u>	<u>At least one of the following CVM shall be supported</u> — <u>Mobile Code (m-commerce) or Personal Code (e-commerce)</u> — <u>PIN on additional authentication device (does not involve virtual POI) Refer to “Authentication” above</u>	
<u>CVM entry on consumer device or on additional authentication device</u>	<u>Conditional, if Cardholder Verification is performed</u>	
<u>Cardholder Verification Method</u>	<u>At least one of the following CVM shall be supported</u> <ul style="list-style-type: none"> — <u>Mobile Code (m-commerce) or Personal Code (e-commerce)</u> — <u>PIN on additional authentication device (does not involve virtual POI)</u> 	<u>No CVM required</u>
<u>CVM entry on consumer device or on additional authentication device</u>	<u>Mandatory</u>	<u>Optional</u>

¹³ Note that some of the methods used for dynamic authentication also facilitate Cardholder authentication (e.g., OTP in some implementations). Redirection to the Card issuer domain may occur.

Table 5528: Remote Transaction One-off Payment - Acceptance Characteristics

The following table describes the characteristics of this context from an Issuance perspective:

<u>Characteristics of the context</u>	<u>Virtual POI</u>	
<u>Characteristics of the context</u>	<u>Virtual POI</u>	
	<u>with Cardholder Verification</u>	<u>without Cardholder Verification</u>
Final amount known	Y	
Authorisation	The (M)RP Application if present in the consumer device shall support Online Authorisation and in addition may support Offline Authorisation	
Card Authentication	Static authentication for low risk payments (see [EBA]) Dynamic Authentication ¹⁴	
<u>Passive Risk-Based Authentication</u>	Optional, but requires redirection to the Card issuer domain	
<u>Cardholder Verification Method</u>	<u>At least one of the following CVM shall be supported</u> <ul style="list-style-type: none"> <u>Mobile Code (m-commerce) or Personal Code (e-commerce)</u> <u>PIN on additional authentication device (does not involve virtual POI)</u> 	
<u>Cardholder Verification Method</u>	<u>At least one of the following CVM shall be supported</u> <ul style="list-style-type: none"> <u>Mobile Code (m-commerce) or Personal Code (e-commerce)</u> <u>PIN on additional authentication device (does not involve virtual POI)</u> 	<u>No CVM required</u>

Table 57: CARD SERVICES - VOLUME CONFORMANT IMPLEMENTATIONS

5. USE CASES

5.1. Card Transactions

5.1.1. Introduction

In this section a number of use cases will be described to illustrate mobile contactless transactions. The following table provides an overview of the possible combinations for contactless transactions:

	No CVM	On-line Online PIN	Mobile CodeCDCVM
On-line Online transaction	Card and Mobile Contactless	Card and Mobile Contactless	Mobile Contactless Single tap/Double Tap
Off-line Offline transaction	Card and Mobile Contactless ¹⁵		Mobile Contactless Single tap/Double Tap

Below, some use cases are presented as diagrams with a description of the different steps involved. They map as follows into this table:

	No CVM	On-line Online PIN	Mobile CodeCDCVM
On-line Online transaction	Use case 23	Use case 34	Use Case 5
Off-line Offline transaction	Use case 45		Use case 1 (single tap) Use case 2 (double tap)

A use case for an ~~On-line~~Online transaction with mobile codeCDCVM is not described in this release of Book 6.

¹⁵ With appropriate risk management in the MCP Application.

5.1.5.1.2. Mobile Contactless

5.1.5.1.2.1. Use case 1: Mobile Contactless - Single Tap - ~~Off-line~~Offline transaction - ~~Off-line~~Offline CVM

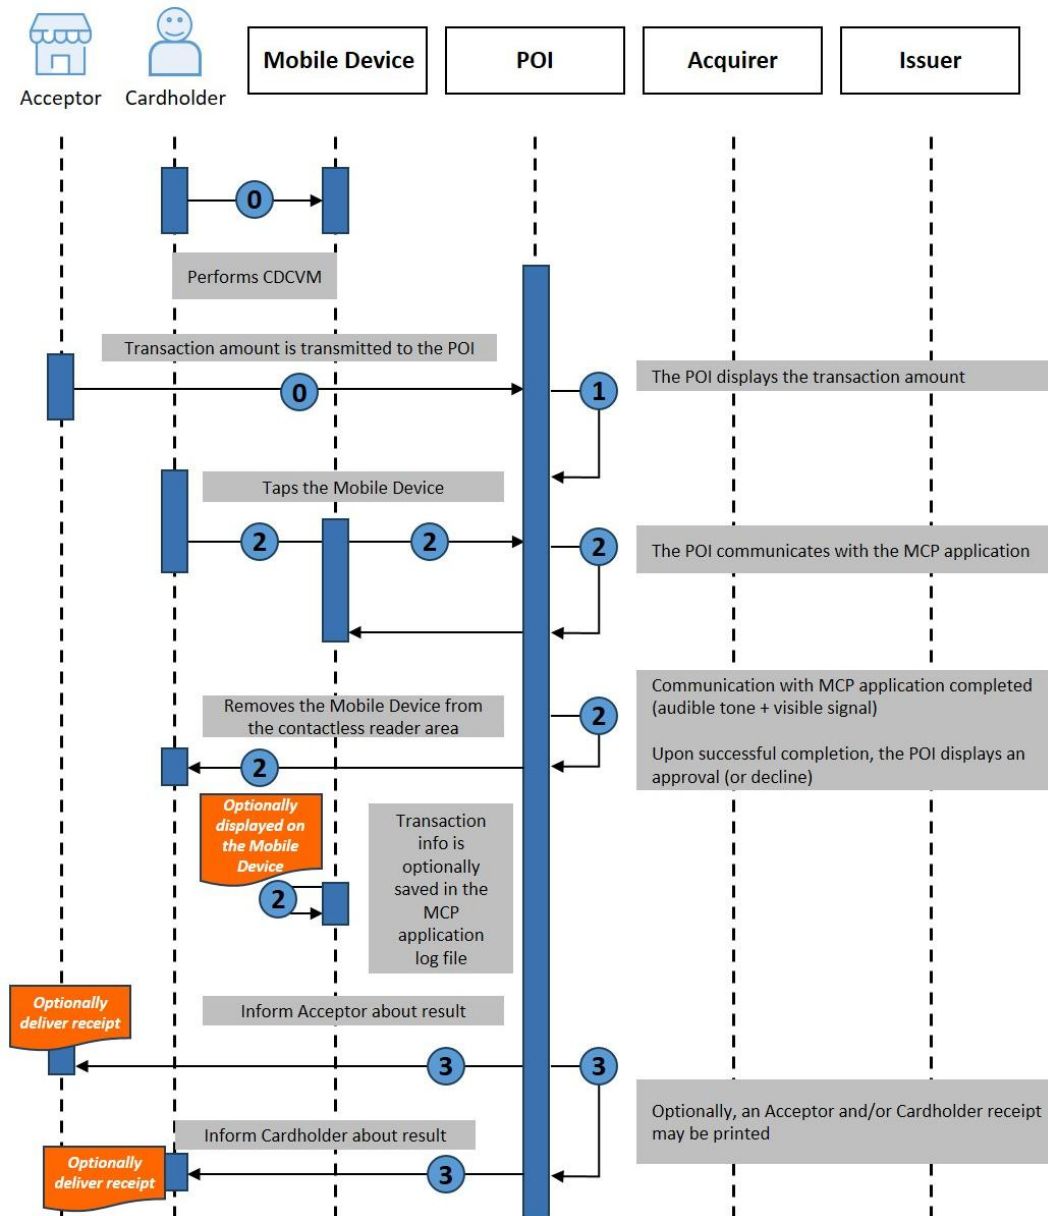

Figure 58: Single Tap - ~~off-line~~offline transaction - ~~off-line~~offline CVM

Step 0 (Pre-requisite)

- The Cardholder either selects a payment Card via a dedicated menu on their mobile device for the payment or the default payment Card (preselected on the Cardholder's mobile device) is automatically used for the payment.
- ~~The Cardholder enters their mobile code~~CDCVM ~~Cardholder is verified by the used CDCVM which is verified by the~~and the MCP Application is informed of the result.
- The ~~acceptor enters the~~ transaction amount is transmitted to~~on~~ the POI.

Step 1

- The transaction amount is displayed on the ~~acceptor's~~ POI.
- The POI requests to present for a Card ~~payment~~.

Step 2

- The Cardholder taps ~~his/her~~their ~~Mmobile~~ ~~phone~~ ~~Device~~ on the contactless reader area. (The Cardholder holds ~~his/her~~their ~~Mmobile~~ ~~phone~~ ~~Device~~ close to the contactless reader area until an audible tone and/or a visible signal takes place).
- The POI uses the contactless technology and selects the appropriate MCP Application ~~through using~~ the PPSE.
- The ~~contactless reader~~POI and MCP Application mutually determine appropriate processing for the transaction, including analysing and applying relevant risk management parameters.
- An audible tone and/or visible signal then indicate that the Mobile Device - POI interaction is completed. After this, subsequently, the Mobile Device can may be removed from the contactless reader area. An audible tone and/or visible signal then indicate that the mobile phone - contactless reader interaction is completed. After this, the mobile phone can be removed from the contactless reader area. Note, however, that the transaction processing at the POI might still continue.
- An ~~off-line~~offline Card authentication/ transaction authorisation is performed by the POI.
- After processing the ~~off-line~~offline authorisation, the ~~acceptor's~~ POI displays an approval or decline.
- Information about the current transaction is optionally saved in the MCP Application log file.
- Information about the current transaction is optionally ~~log file and optionally~~ displayed on the ~~Mmobile~~ ~~phone~~ ~~Device~~.

Step 3

- The ~~a~~Aceptor is informed about the result of the transaction.
- The Cardholder is informed about the result of the transaction.

- ~~An Acceptor and/or Cardholder receipt may be printed. Depending on the purchase payment amount, the acceptor's POI features and Cardholder choice, a transaction receipt may be printed.~~

5.1.2. Use case 2: Mobile Contactless Double Tap Off lineOffline transaction Off lineOffline CVM

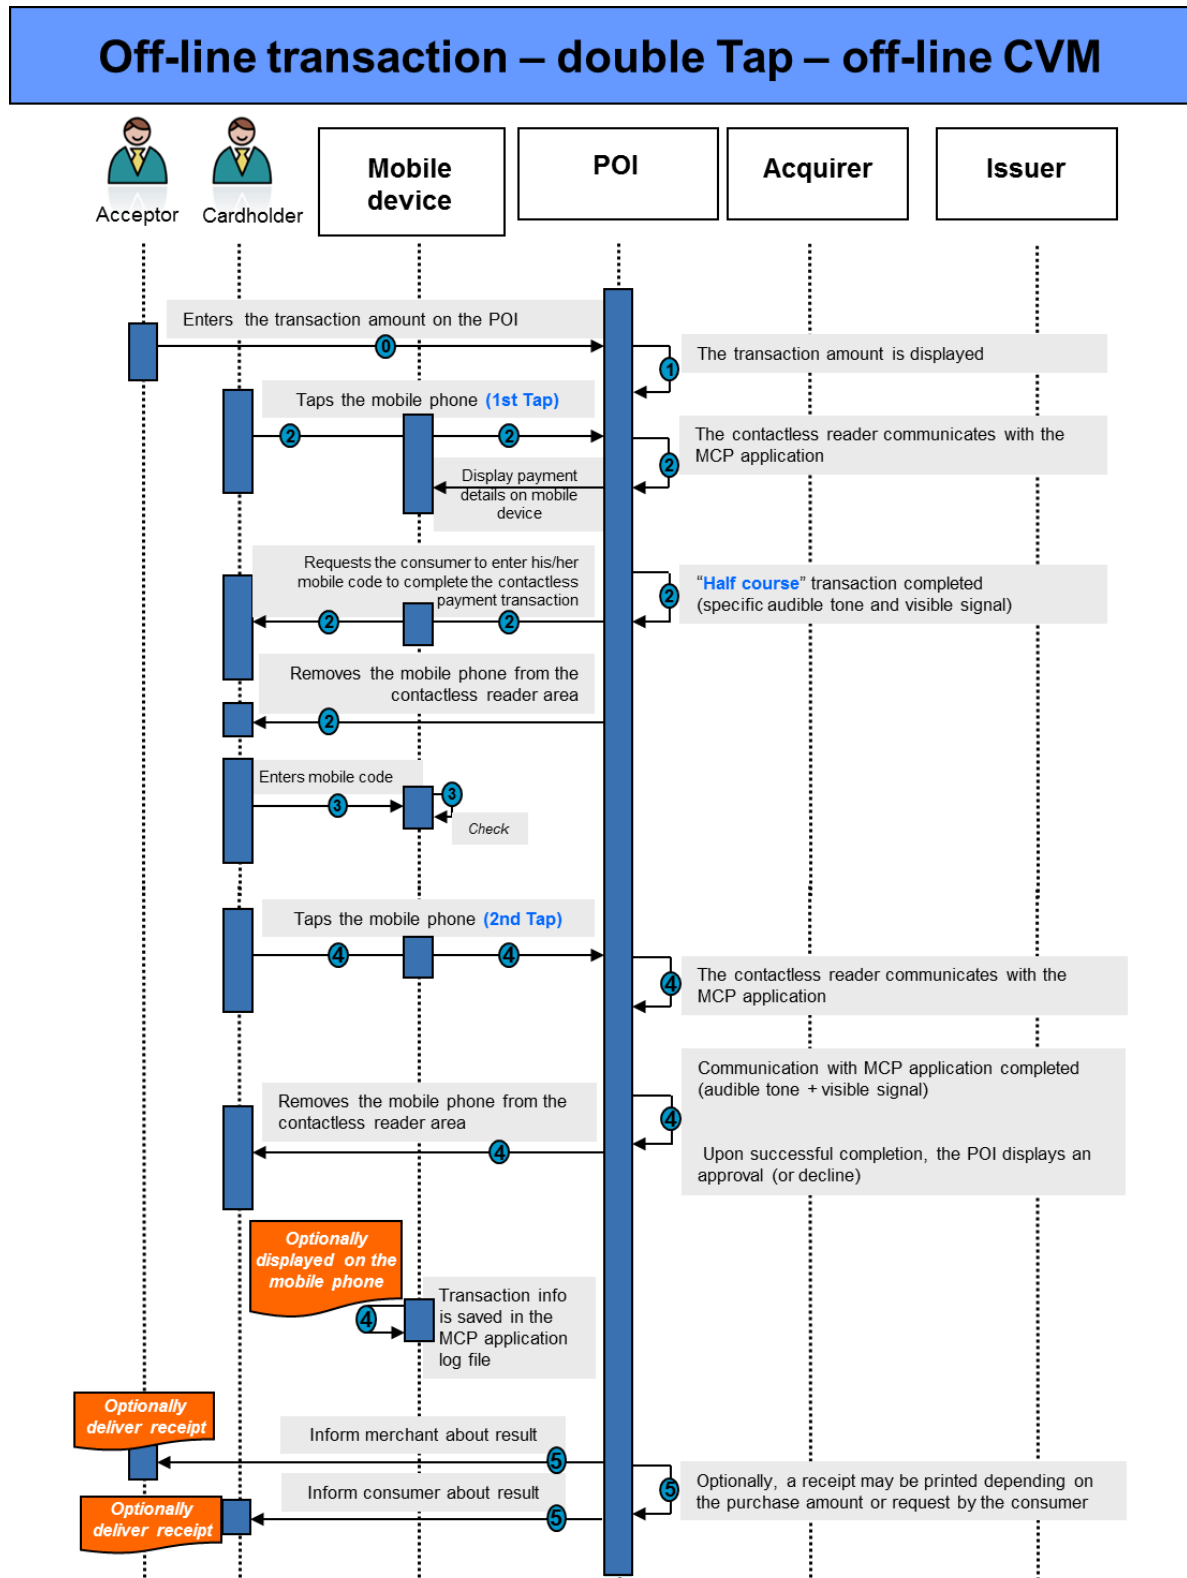

Figure 59: Double Tap – Off-line~~Offline~~ transaction – Offline CVM

Step 0 (Pre-requisite)

- The ~~Acceptor~~ enters the transaction amount on the POI Terminal.

Step 1

- The transaction amount is displayed on the acceptor's POI Terminal.
- The POI requests for a Card payment.

Step 2

- The Cardholder taps (1st Tap) his/her mobile phone on the contactless reader area. (The Cardholder holds his/her mobile phone close to the contactless reader area until audible tone and/or visible signal take place).
- The POI uses the contactless technology and selects the appropriate MCP Application through the PPSE.
- The contactless reader and MCP Application mutually determine appropriate processing for the transaction, including analysing and applying relevant risk management parameters. In this case, related to CVM, it is determined that a n off-line~~offline~~ CDCVM (mobile code) is required.
- A specific audible tone and/or visible signal indicate that the first step of the transaction is completed and that the Cardholder Customer is requested to enter perform their CDCVM mobile code to complete the contactless payment transaction.
- The Cardholder then removes his/her mobile phone from the contactless reader area.

Step 3

- The Cardholder Customer checks the purchase amount and enters his/her mobile code~~performs their CDCVM~~ on the mobile phone.
- Upon successful performing the verification of the mobile code~~CDCVM~~, a message is displayed on the mobile phone requiring the Cardholder Customer to tap again his/her mobile phone on the contactless reader area.

Step 4

- The Cardholder taps again (2nd Tap) his/her mobile phone on the contactless reader area.

- ~~• An audible tone and/or visible signal then indicate that the mobile phone contactless reader interaction is completed. After this the mobile phone can be removed from the contactless reader area. Note, however, that the transaction processing at the POI might still continue.~~
- ~~• An off lineoffline MCP Application authentication/authorisation is performed by the POI.~~
- ~~• After processing the off lineoffline authorisation, the Acceptor's POI Terminal displays an approval or decline message.~~
- ~~• Information about the current transaction (e.g., transaction amount) is saved in the MCP Application log file and optionally displayed on the mobile phone.~~

Step 5

- ~~• The Acceptor is informed about result of the transaction.~~
- ~~• The Cardholder is informed about result of the transaction.~~
- ~~• Depending on the purchase amount, the Acceptor's POI Terminal features and Cardholder choice, a transaction receipt may be printed.~~

5.1.3.5.1.2.2. Use case 23: Mobile contactless - Single Tap - ~~On-line~~Online transaction - no CVM

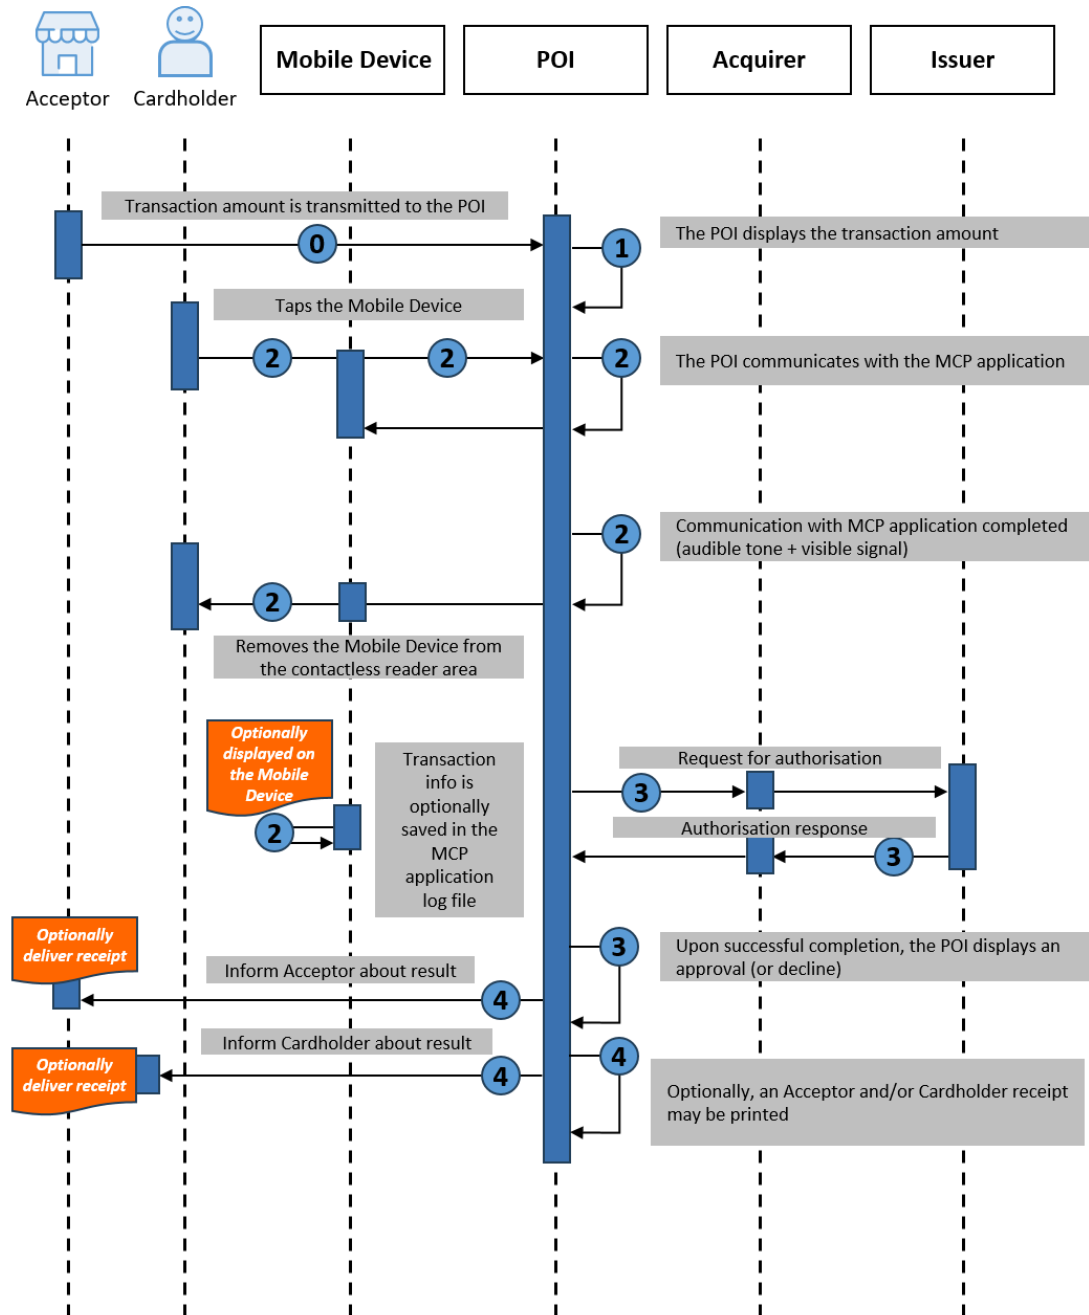

Figure 59: Single Tap - ~~On-line~~Online transaction - no CVM

Step 0 (Pre-requisite)

- The Cardholder either selects a payment Card via a dedicated menu on their mobile device for the payment or the default payment Card (preselected on the Cardholder's mobile device) is automatically used for the payment.
- The transaction amount is transmitted to the POI.
- ~~The Cardholder either selects a payment Card via a dedicated menu on his/her mobile device for the payment or the default payment Card (preselected on the Cardholder's mobile device) is automatically used for the payment.~~
- ~~The acceptor enters the transaction amount on the POI.~~

Step 1

- The transaction amount is displayed on the ~~acceptor's~~ POI.
- The POI requests to present a Card ~~payment~~.

Step 2

- The Cardholder taps their Mobile Device on the contactless reader area. (The Cardholder holds their Mobile Device close to the contactless reader area until an audible tone and/or a visible signal takes place).
- ~~The Cardholder taps his/her mobile phone on the contactless reader area. (The Cardholder holds his/her mobile phone close to the contactless reader area until audible tone and/or visible signal take place).~~
- The POI uses the contactless technology and selects the appropriate MCP Application using the PPSE. ~~The POI selects the appropriate MCP Application through the PPSE.~~
- The ~~contactless reader~~POI and MCP Application mutually determine appropriate processing for the transaction, including analysing and applying relevant risk management parameters. In this case, related to CVM, it is determined that no CVM is required.
- An audible tone and/or visible signal then indicate that the ~~Mmobile phone Device - contactless reader~~POI interaction is completed. After this, subsequently, the ~~mobile Mobile pDevicehone can may~~ be removed from the contactless reader area. ~~Note however that the transaction processing at the POI might still continue.~~
- ~~The Cardholder then removes their Mobile Device from the contactless reader area.~~
- An ~~off-line~~offline Card authentication is optionally performed by the POI.
- An ~~on-line~~online Card authentication / transaction authorisation is performed by the POI.

- ~~• The Cardholder then removes his/her mobile phone from the contactless reader area.~~
- Information about the current transaction is optionally saved in the MCP Application log file.
- Information about the current transaction is optionally displayed on the Mobile Device.~~Information about the current transaction is saved in the MCP Application log file and optionally displayed on the mobile phone.~~

Step 3

- After processing the ~~on-line~~online authorisation, the ~~acceptor's~~ POI displays an approval or decline.

Step 4

- The Acceptor is informed about the result of the transaction.
- The Cardholder is informed about the result of the transaction.
- ~~• An Acceptor and/or Cardholder receipt may be printed. The acceptor is informed about the result of the transaction.~~
- ~~• The Cardholder is informed about the result of the transaction.~~
- ~~• Depending on the purchase amount, the acceptor's POI features and Cardholder choice, a transaction receipt may be printed.~~

~~Note: A similar use case can be described for an online contactless Card transaction (single brand) with no CVM.~~

5.1.4.5.1.2.3. Use case 34: Mobile contactless - Single Tap - ~~On-line~~Online transaction - ~~On-line~~Online CVM

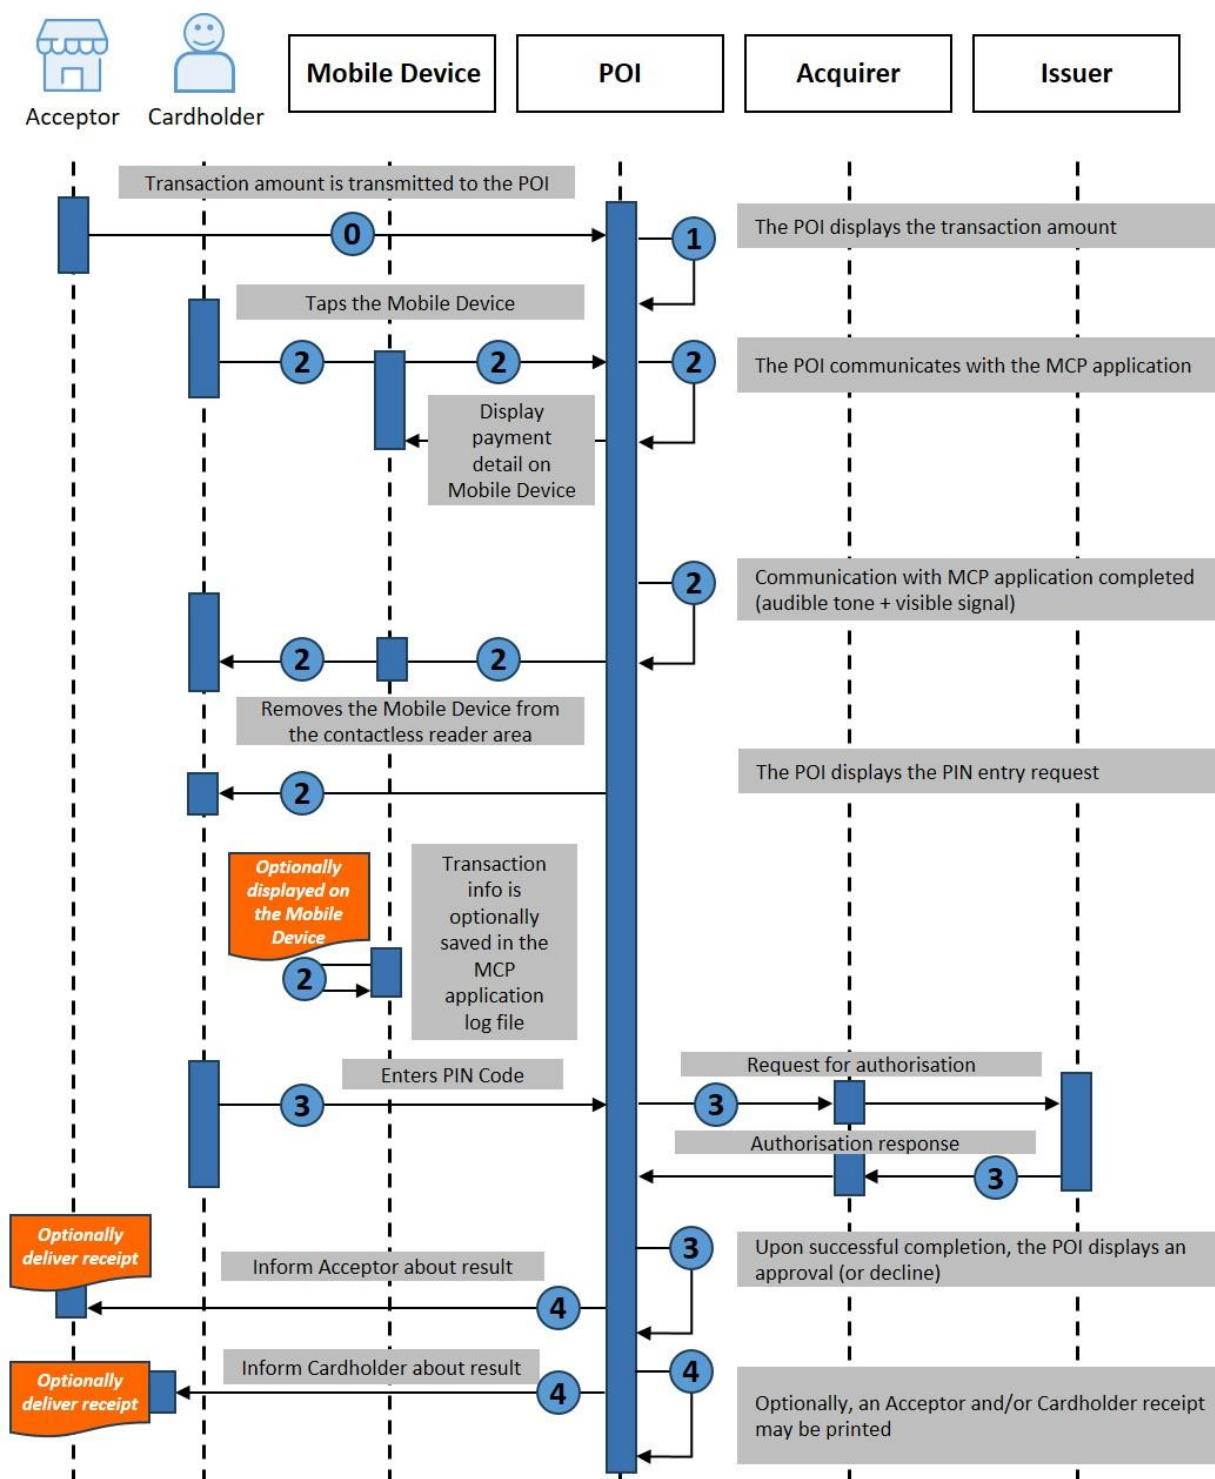

Figure 60: Single Tap - ~~On-line~~Online transaction - ~~On-line~~Online CVM

Step 0 (Pre-requisite)

- The Cardholder either selects a pPayment Card via a dedicated menu on his/her Mmobile dDevice for the payment or the default Ppayment Card (preselected on the Cardholder's Mmobile Ddevice) is automatically used for the payment.
- The transaction amount is transmitted to the POI.
- ~~The acceptor enters the transaction amount on the POI.~~

Step 1

- The transaction amount is displayed on the ~~acceptor's~~ POI.
- The POI requests ~~for to present~~ a Card-payment.

Step 2

- The Cardholder taps their Mobile Device on the contactless reader area. (The Cardholder holds their Mobile Device close to the contactless reader area until an audible tone and/or a visible signal takes place).
- ~~The POI uses the contactless technology and selects the appropriate MCP Application using the PPSE. The Cardholder taps his/her mobile phone on the contactless reader area. (The Cardholder holds his/her mobile phone close to the contactless reader area until an audible tone and/or visible signal occur).~~
- ~~The POI selects the appropriate MCP Application through the PPSE.~~
- The contactless reader and MCP Application mutually determine appropriate processing for the transaction, including analysing and applying relevant risk management parameters. In this case, related to CVM, it is determined that an ~~on-line~~online CVM (PIN code on the POI) is required.
- ~~A specific audible tone and/or visible signal indicate that "half course" transaction is completed and that the Cardholder is requested to enter his/her PIN code on the POI to complete the contactless payment transaction.~~
- ~~The Cardholder can remove his/her mobile phone from the contactless reader area. An audible tone and/or visible signal then indicate that the Mobile Device - POI interaction is completed. After this, subsequently, the Mobile Device may be removed from the contactless reader area.~~
- A display message on the POI requests the Cardholder to enter their PIN code.
- An ~~off-line~~offline Card authentication is optionally performed by the POI.
- Information about the current transaction is optionally saved in the MCP Application log file.

- Information about the current transaction is optionally displayed on the Mobile Device~~Information about the current transaction is saved in the MCP Application log file and optionally displayed on the mobile phone.~~

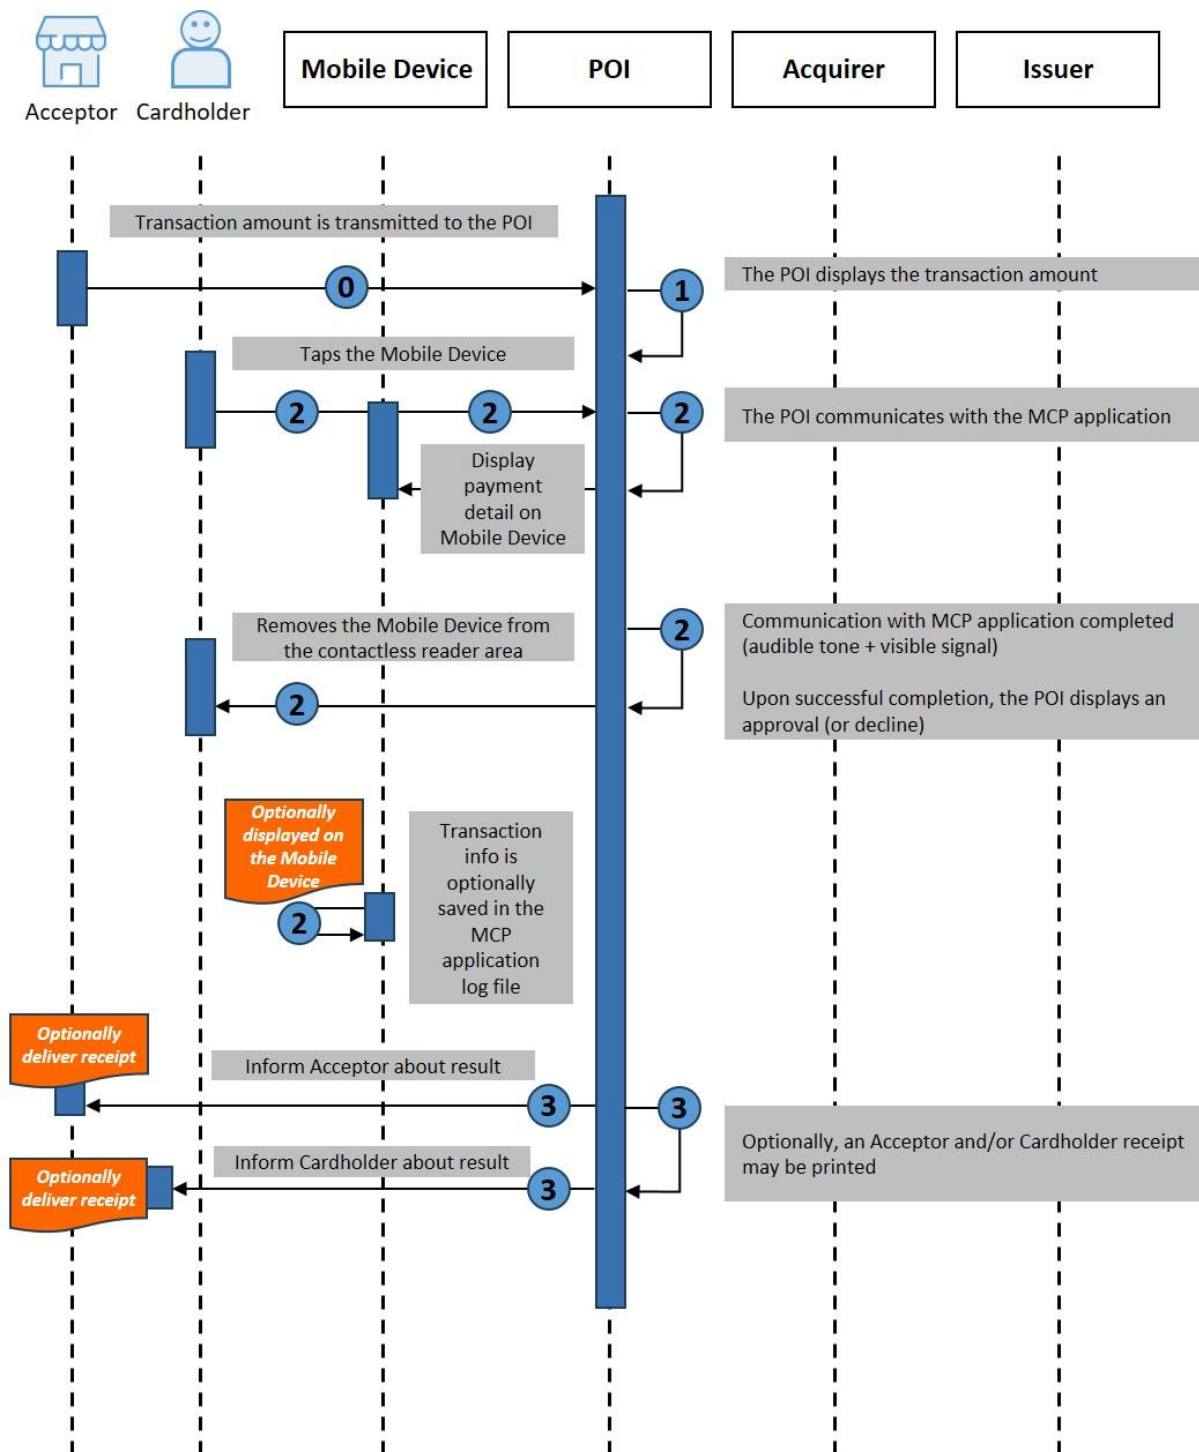

Step 3

- The Cardholder checks the purchase amount and enters ~~his/her~~their PIN code on the ~~acceptor's~~ POI.
- An ~~on-line~~online Card authentication / transaction authorisation is performed by the POI.
- After processing the ~~on-line~~online authorisation, the ~~acceptor's~~ POI ~~Terminal~~ displays an approval or decline.

Step 4

- The ~~A~~aceptor is informed about result of the transaction.
- The Cardholder is informed about result of the transaction.
- An Acceptor and/or Cardholder receipt may be printed.

- Depending on the purchase amount, the acceptor's POI features and Cardholder choice, a transaction receipt may be printed.

Note: A similar use case can be described for an online contactless Card transaction (single brand) with online-CVM.

5.1.4.1.5.1.2.4. Use case 45: Mobile Contactless - Single Tap - ~~Off-line~~Offline transaction - no CVM

Figure 61: Single Tap - ~~Off-line~~Offline transaction - no CVM

Step 0 (Pre-requisite)

- The Cardholder either selects a ~~P~~ayment Card via a dedicated menu on his/her ~~M~~mobile ~~D~~evice for the payment or the default ~~P~~ayment Card (preselected on the Cardholder's ~~M~~mobile ~~D~~evice) is automatically used for the payment.
- The transaction amount is transmitted to the POI.
- ~~The acceptor enters the transaction amount on the POI.~~

Step 1

- The transaction amount is displayed on the ~~acceptor's~~ POI.
- The POI requests ~~for to present~~ a Card ~~payment~~.

Step 2

- The Cardholder taps ~~his/her~~their ~~m~~Mmobile ~~phone~~ ~~Device~~ on the contactless reader area. (The Cardholder holds ~~his/her~~their ~~m~~Mmobile ~~phone~~ ~~Device~~ close to the contactless reader area until an audible tone and/or a visible signal takes place).
- The POI uses the contactless technology and selects the appropriate MCP Application using the PPSE. The contactless reader and MCP Application mutually determine appropriate processing for the transaction, including analysing and applying relevant risk management parameters.
- ~~The POI selects the contactless technology.~~
- ~~The POI checks the available Applications and selects the appropriate MCP Application through the PPSE.~~
- ~~The contactless reader and MCP Application⁺⁶ mutually determine appropriate processing of the transaction, including analysing and applying relevant risk management parameters.~~

⁺⁶ ~~In this use case it is assumed that the MCP Application has appropriate risk management capabilities.~~

- ~~An audible tone and/or visible signal then indicate that the Mobile Device - POI interaction is completed. After this, subsequently, the Mobile Device may be removed from the contactless reader area.~~An audible tone and/or visible signal then indicate that the mobile phone – contactless reader interaction is completed. After this, the mobile phone can be removed from the contactless reader area. Note, however, that the transaction processing at the POI might still continue.
- An ~~off-line~~offline Card authentication/ transaction authorisation is performed by the POI.
- After processing the ~~off-line~~offline authorisation, the ~~acceptor's~~ POI displays an approval or decline.
- Information about the current transaction is optionally saved in the MCP Application log file.
- Information about the current transaction is optionally displayed on the Mobile Device.
- ~~Information about the current transaction is saved in the MCP Application log file and optionally displayed on the mobile phone.~~

Step 3

- The ~~A~~acceptor is informed about the result of the transaction.
- The Cardholder is informed about the result of the transaction.
- An Acceptor and/or Cardholder receipt may be printed.
- ~~Depending on the purchase amount, the acceptor's POI features and Cardholder choice, a transaction receipt may be printed.~~

~~Note: A similar use case can be described for an offline contactless Card transaction (single brand) with "no CVM".~~

5.1.2.5. Use case 65: Mobile contactless - Single Tap - Online transaction - CDCVM

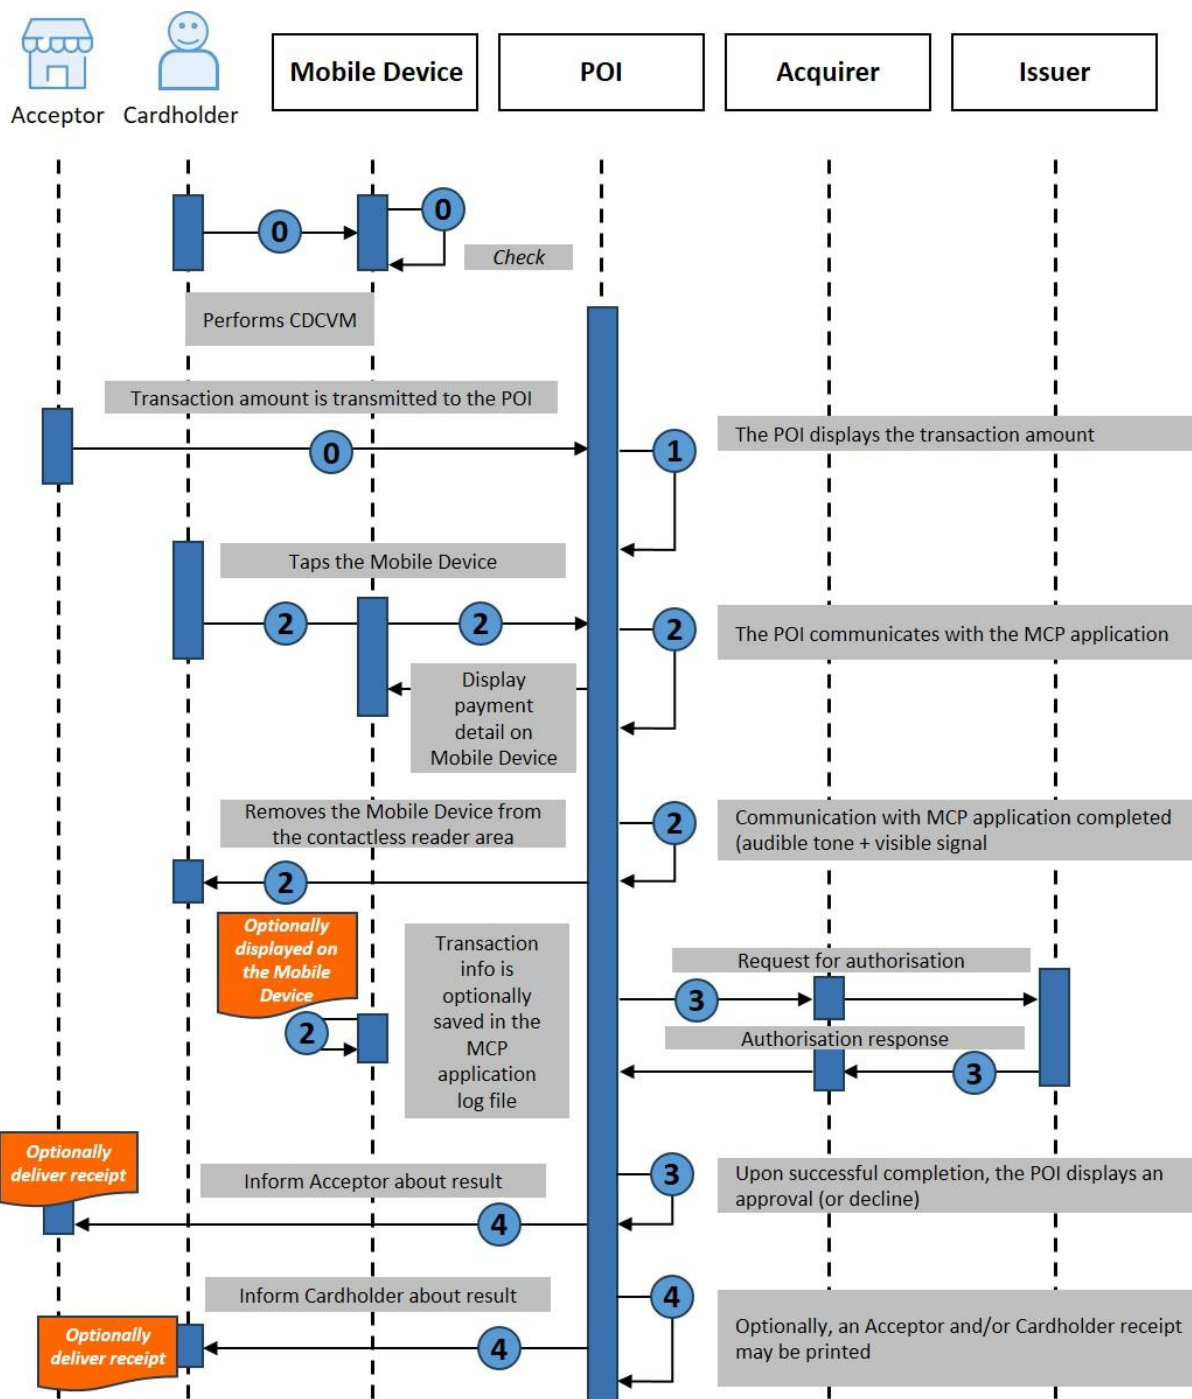

Figure 62: Single Tap - Online transaction - CDCVM

Step 0 (Pre-requisite)

- The Cardholder either selects a Payment Card via a dedicated menu on his/her Mobile Device for the payment or the default Payment Card (preselected on the Cardholder Customer's Mobile Device) is automatically used for the payment.
- The Cardholder enters their performs CDCVM which is verified by the MCP Application.
- The transaction amount is transmitted to the POI. The Acceptor enters the transaction amount on the POI.

Step 1

- The transaction amount is displayed on the Acceptor's POI.
- The POI requests to present a Card payment.

Step 2

- The Cardholder taps their Mobile Device on the contactless reader area. (The Cardholder holds their Mobile Device close to the contactless reader area until an audible tone and/or a visible signal takes place).
- The POI uses the contactless technology and selects the appropriate MCP Application using the PPSE. The contactless reader and MCP Application mutually determine appropriate processing for the transaction, including analysing and applying relevant risk management parameters. In this case, related to CVM, it is determined by the MCP Application that an offline CDCVM is required and has been performed.
- An audible tone and/or visible signal then indicate that the Mobile Device - POI interaction is completed. After this, subsequently, the Mobile Device may be removed from the contactless reader area.
- An online Card authentication/ transaction authorisation is performed by the POI.
- After processing the online authorisation, the POI displays an approval or decline.
- Information about the current transaction is optionally saved in the MCP Application log file.
- Information about the current transaction is optionally displayed on the Mobile Device.
- The Cardholder Customer taps his/her mobile phone on the contactless reader area. (The Cardholder Customer holds his/her mobile phone close to the contactless reader area until audible tone and/or visible signal take place).
- The POI selects the appropriate MCP Application through the PPSE.

- ~~— The contactless reader and MCP Application mutually determine appropriate processing for the transaction, including analysing and applying relevant risk management parameters. In this case, related to CVM, it is determined by the MCP Application that no an offline CDCVM is required and has been performed.~~
- ~~— An audible tone and/or visible signal then indicate that the mobile phone contactless reader interaction is completed. After this, subsequently, the mobile phone can be removed from the contactless reader area. Note however that the transaction processing at the POI might still continue.~~
- ~~— An online Card authentication / transaction authorisation is performed by the POI.~~
- ~~— The CardholderCustomer then removes his/hertheir mobile phone from the contactless reader area.~~
- ~~— Information about the current transaction is saved in the MCP Application log file and optionally displayed on the mobile phone.~~

Step 3

- After processing the online authorisation, the Aacceptor's POI displays an approval or decline.

Step 4

- The Aacceptor is informed about the result of the transaction.
- The Cardholder is informed about the result of the transaction.
- An Acceptor and/or Cardholder receipt may be printed. Depending on the purchase amount, the Aacceptor's POI features and CardholderCustomer choice, a transaction receipt may be printed.

5.2.5.1.3. E and m commerce

5.2.1.5.1.3.1. SCA-exempted e- & m-commerce with Static Authentication - No CVM

In this scenario, illustrated in the figure below, the ~~CardholderCustomer~~ uses ~~his/hertheir~~ ~~Ce~~consumer ~~D~~evice to conduct a payment to an ~~Aa~~acceptor, which is providing goods or services (e.g., mobile content). In this scenario, no CVM method is used.

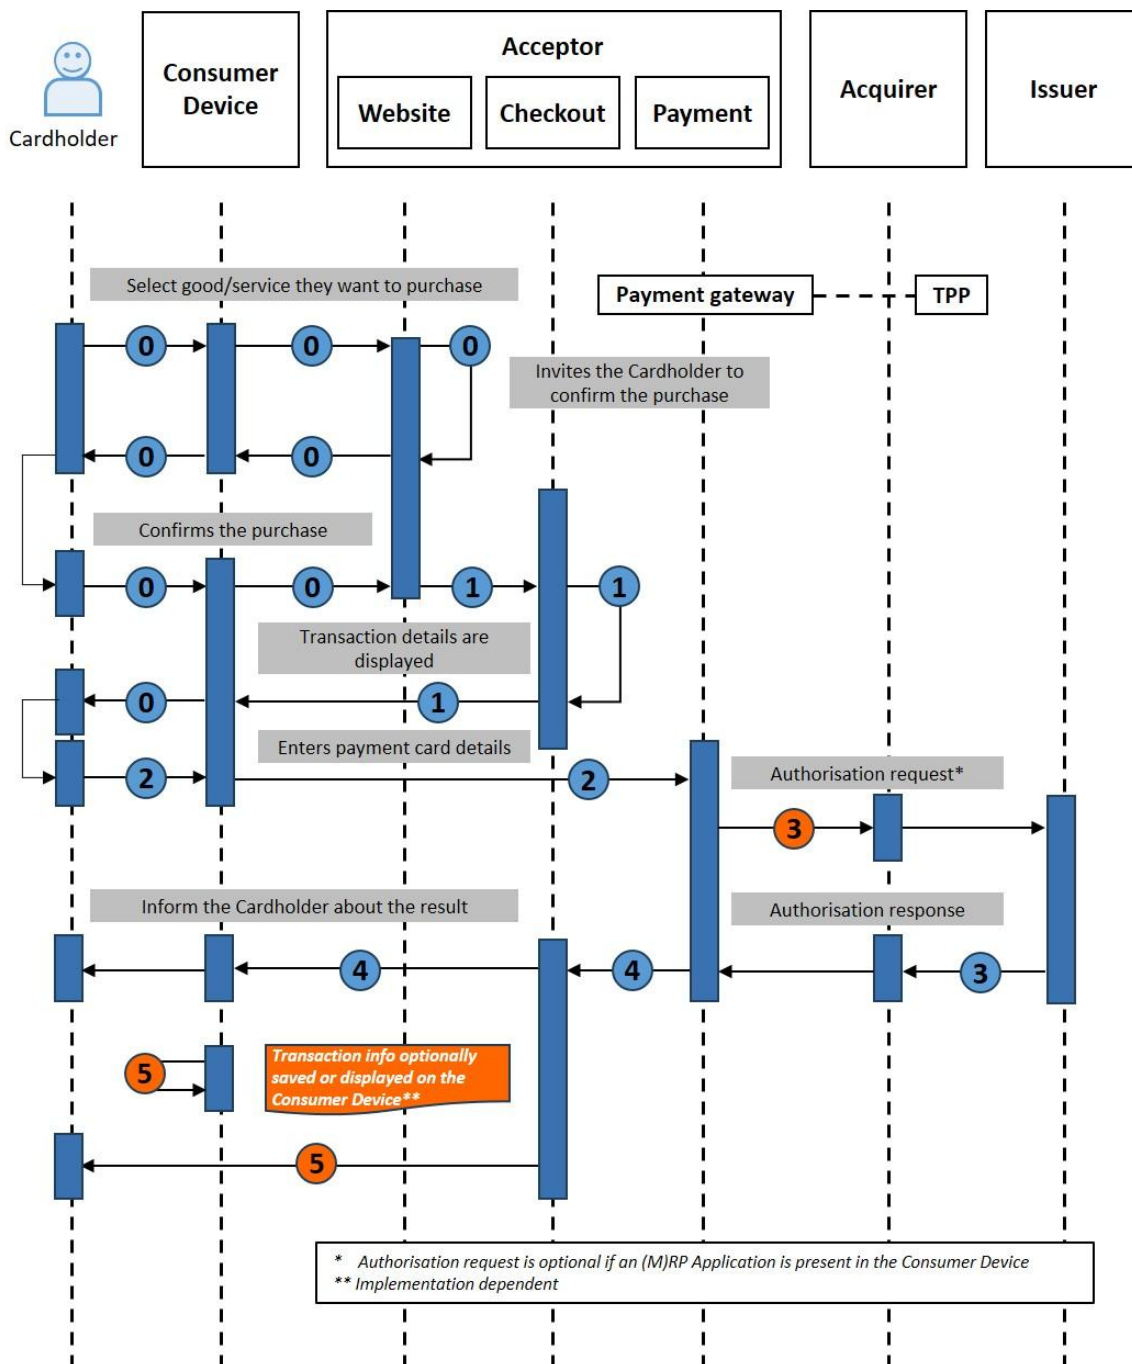

Figure 63: e- & m-commerce with Static Authentication- No CVM

In the figure above, the following steps are illustrated:

Step 0 (Pre-requisite)

- The Cardholder navigates using ~~his/her~~their ~~Consumer Device~~ to an acceptor website via internet and selects the goods / service ~~he/she~~they wants to purchase.
- After having accepted the general purchase conditions, ~~he/she~~they are invited to confirm the purchase.

Step 1 (Transaction details displayed)

- The checkout section of the Aacceptor website displays the transaction details including the amount and the payment options, via the Consumer Device to the Cardholder.

Step 2 (Card payment selection)

- The Cardholder selects the "payment by Card" option via internet and is subsequently redirected to the payment section under the control of a payment gateway to proceed with the transaction under a secure http connection (https). ~~He/she is~~ The Cardholder is invited to enter ~~his/her~~ their Payment Card details (e.g., PAN, expiry date and CSC).
- As an alternative to the entry of the Payment Card details by the Cardholder, there may be an Application stored in, or accessed through, the Consumer Device. The Cardholder is then redirected to the user interface of this Application to select the Payment Card to be used and the Card details are automatically transferred to the payment section.
- The transaction summary is displayed on the Consumer Device, typically including the date, the Aacceptor reference, the amount and the selected Payment Card whereby the Cardholder is invited to confirm the transaction.

Step 3 (Payment process)

- The payment is processed as a Remote Card Transaction. This typically¹⁷ involves an ~~on-line~~ online authorisation request by the Aacceptor to ~~the~~ the Issuer, at which time static authentication occurs.

Step 4 (Transaction finalisation)

Once the payment is authorised,

- The Cardholder is automatically redirected to the Aacceptor website and receives a confirmation of the transaction;
- The acceptor releases the good / service to the Cardholder.

Step 5 (Transaction information)

- Transaction information (such as the transaction amount) may be saved in an (M)RP Application log file and / or optionally displayed on the Consumer Device.
- An electronic receipt may be made available by the Aacceptor to the Cardholder.

¹⁷ In particular cases, if an (M)RP Application is present in the Consumer Device, the authorisation request could be optional, depending on the type of Payment Card and the Aacceptor's decision. But, in any case, the capability to do an authorisation request must be there.

5.2.2.5.1.3.2. e- and m-commerce with dynamic authentication

In this scenario, illustrated in the figure below, the Cardholder uses ~~his/her~~^{their} ~~C~~consumer ~~D~~evice to conduct a payment to an ~~A~~acceptor, which is providing goods or services (e.g., mobile content). This scenario uses a "dynamic authentication method", i.e. a combination of Card authentication with a CVM.

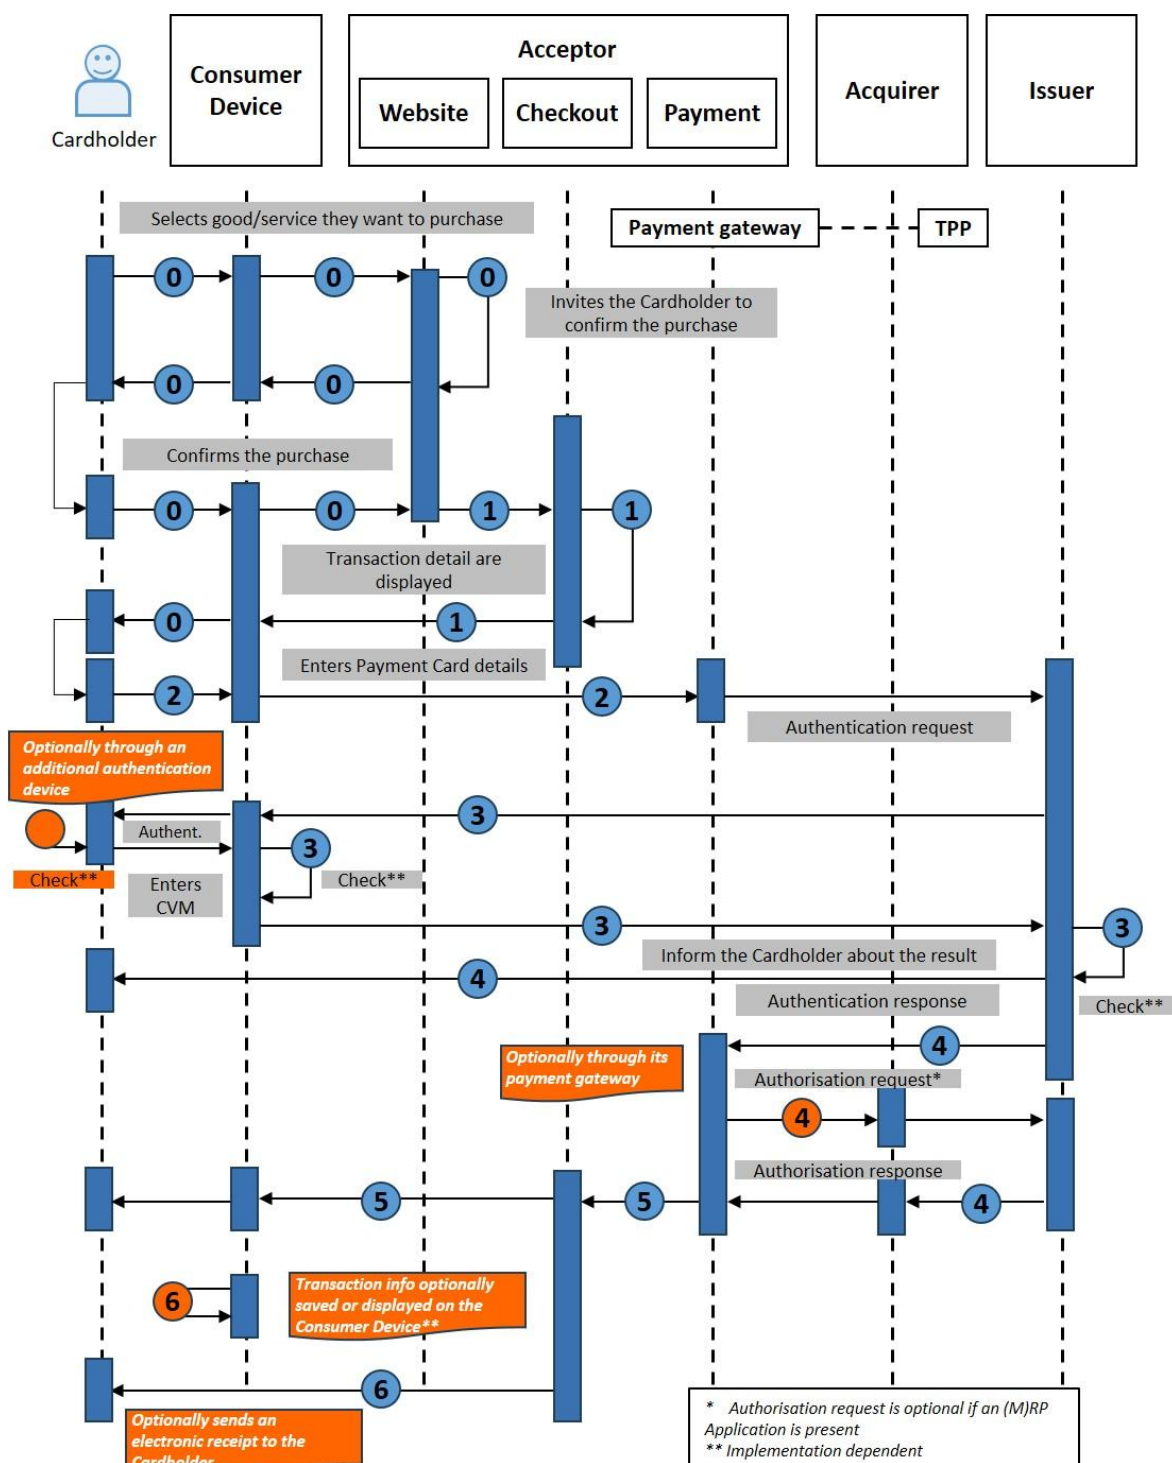

Figure 64: e- & m-commerce with dynamic authentication

In the figure above, the following steps are illustrated:

Step 0 (Pre-requisite)

- The Cardholder navigates using ~~his/her~~their ~~C~~consumer ~~device~~Device to an ~~A~~acceptor website via internet and selects the goods / service ~~he/she~~they wants to purchase.
- After having accepted the general purchase conditions, ~~he/she~~the Cardholder is invited to confirm the purchase.

Step 1 (Transaction details displayed)

- The checkout section of the ~~a~~Aacceptor website displays the transaction details including the amount and the payment options, via the ~~e~~Cconsumer ~~D~~evice to the Cardholder.

Step 2 (Card payment selection)

- The Cardholder selects the "payment by Card" option via internet and is subsequently redirected to the payment section under the control of a payment gateway to proceed with the transaction under a secure http connection (https). ~~He/she~~The Cardholder is invited to enter ~~his/her~~their payment Card details (e.g., PAN, expiry date and CSC).
- As an alternative to the entry of the ~~P~~payment Card details by the Cardholder, there may be an Application stored in, or accessed through, the ~~e~~Cconsumer ~~D~~evice. The Cardholder is then redirected to the user interface of this Application to select the ~~p~~Payment Card to be used and the Card details are automatically transferred to the payment section.
- The transaction summary is displayed on the ~~C~~consumer ~~D~~evice, typically including the date, the ~~A~~aceptor reference, the amount and the selected ~~P~~payment Card whereby the Cardholder is invited to confirm the transaction.

Step 3 (Authentication)¹⁸

The Cardholder and the relevant data are subsequently authenticated¹⁹ by the ~~i~~Issuer²⁰ or their agent according to one of the following typical processes:

- ~~In case of a Ppayment Card via internet, the Cardholder and the relevant data are authenticated by their iissuer via a dynamic authentication method. Various methods may exist. If an additional authentication device is used, the Cardholder inserts his/hertheir Ppayment Card into the additional device; the iissuer provides the Cardholder with a "challenge" to be entered / transmitted (on)to the additional device,~~

¹⁸ The usage of a CVM in combination with the dynamic authentication results into a ~~s~~Strong ~~C~~customer ~~a~~Authentication.

¹⁹ This authentication may involve transaction details.

²⁰ Or a TPP in the issuer domain.

~~followed by the Cardholder's PIN entry. The authentication device then generates a "response" which the Cardholder is requested to enter at a given time during this process on their Consumer Device. The response is subsequently transmitted to the issuer via the authentication response for verification.~~

- ~~In case an Authentication or (M)RP Application, or remote Payment Application or banking Application from the Issuer~~ is present on the ~~C~~consumer ~~D~~evice, a dynamic authentication method (e.g., challenge/response method) is initiated by the ~~i~~ssuer and is handled automatically by the authentication Application in a secure environment. The Cardholder is also requested to enter ~~his/her~~their personal/mobile code during the transaction process. The personal/mobile code is checked either locally by the Authentication or (M)-RP Application (CDCVM), or on-line by the ~~i~~ssuer.
- ~~In case none of these applications is present on the Consumer Device, another Authentication Method (e.g., OTP and Online Personal Code) means-compliant to regulatory requirements is initiated by the Issuer or the Transaction is declined.~~

Step 4 (Payment process)

- ~~The Cardholder is informed by their i~~ssuer about the result of the authentication.
- ~~The payment gateway is informed of the authentication result through the authentication response.~~
- The ~~A~~acceptor is informed ~~by the issuer about the result of the authentication of the Cardholder.~~ ~~(possibly involving of the authentication result via its the payment gateway)~~
- Subject to successful authentication by the ~~i~~ssuer, the payment is further processed as a Remote Card ~~T~~ransaction. This typically²¹ involves an ~~on-line~~online authorisation request by the ~~a~~Aceptor to the ~~i~~ssuer.

Step 5 (Transaction finalisation)

Once the payment is authorised,

- The Cardholder is automatically redirected to the ~~A~~acceptor website and receives a confirmation of the transaction;
- The ~~A~~acceptor releases the good / service to the Cardholder.

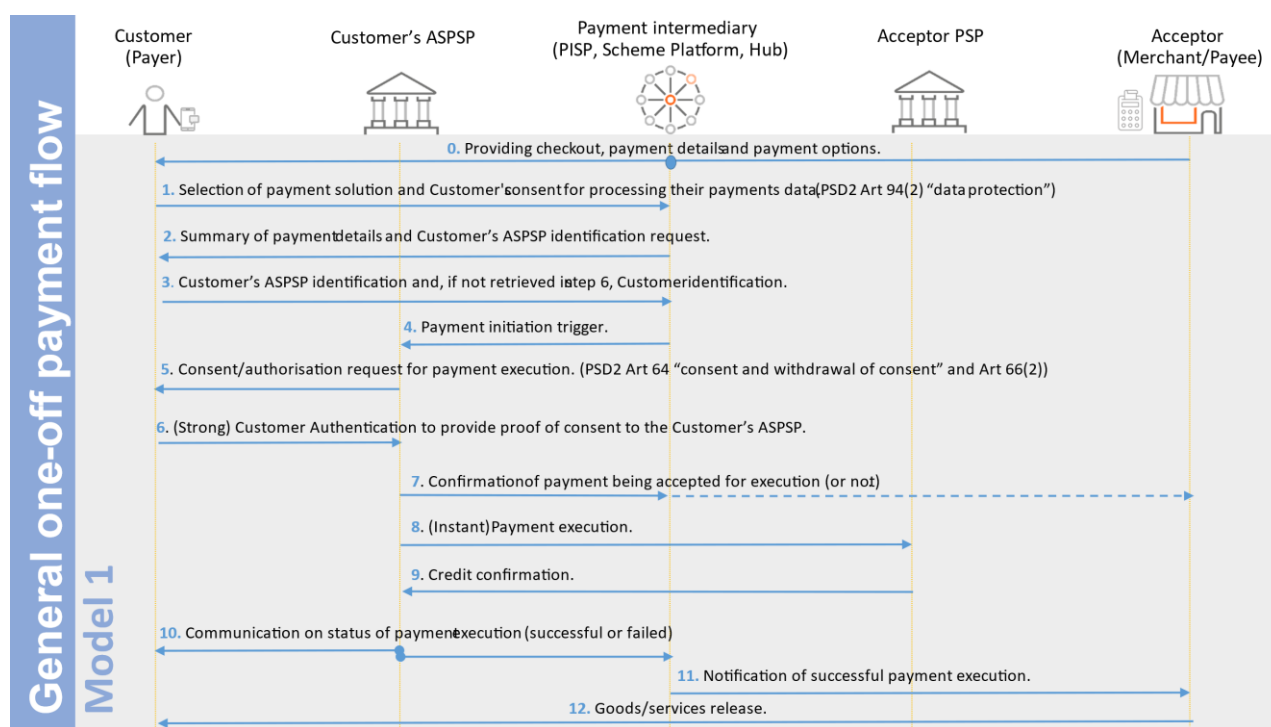

Step 6 (Transaction information)

²¹ In particular cases, if an (M)RP Application is present in the ~~e~~Cconsumer ~~D~~evice, the authorisation request could be optional, depending on the type of ~~P~~ayment Card and the ~~a~~Aceptor's decision. But, in any case, the capability to do an authorisation request must be there.

- Transaction information (such as the transaction amount) may be saved in an (M)RP Application log file and / or optionally displayed on the Consumer Device.
- An electronic receipt may be sent by the Acceptor to the Cardholder.

5.2. Instant Credit Transfer Transactions

In this scenario, illustrated in the figure below, the Customer uses his/her Consumer Device with Instant Payment functionality to conduct a payment to an Acceptor, which is providing goods or services (e.g., mobile content) locally or remote.

In the figure above, the following steps are illustrated:

Step 0 (Checkout)

- The Customer has selected the goods/service he/she wants to purchase in advance to this step
- The Acceptor provides a checkout option with payment details and options for the purchase of those goods/services to the Customer on a Physical or Virtual POI* via and, at the same time, to the Payment Intermediary.

*For Virtual POI, the information for the Customer may be provided through the Payment Intermediary.

Step 1 (Selection of payment solution)

- The Customer makes a selection of payment solution and provides consent for processing their payment data (In accordance with PSD2 art. 94(2) “data protection”)

Step 2 (Payment details and identification request)

- The Payment Intermediary provides the Customer with a payment details summary and sends a ASPSP customer identification request

Step 3 (Identification)

- The Customer provides ASPSP identification and if relevant, customer identification, to the Payment Intermediary

Step 4 (Payment initiation)

- A payment initiation trigger is sent to the Customer’s ASPSP

Step 5 (Authorisation request)

- The Customer’s ASPSP provides the Customer with a consent/authorisation request for payment execution (In accordance with PSD2 art. 64 “consent and withdrawal of consent” and art. 66(2))

Step 6 (Proof of consent)

- The Customer provides (Strong) Customer Authentication to the Customer’s ASPSP to proof consent with the payment execution

Step 7 (Confirmation of payment execution approval)

- The Customer’s ASPSP provides the Payment Intermediary with confirmation of whether or not payment execution is accepted by the Customer. (If not, the payment is cancelled)
- Information of the result of the payment execution request is forwarded to the Acceptor

Step 8 (Payment execution)

- Instant payment execution notification is sent from the Customer’s ASPSP to the Acceptor PSP

Step 9 (Credit information)

- The Customers credit information is provided by the Acceptor PSP to the Customer’s ASPSP

Step 10 (Payment result)

- The Customer's ASPSP communicates the payment execution result to both the Customer and the Payment Intermediary

Step 11 (Result notification)

- The Payment Intermediary notifies the Acceptor of the payment execution result

Step 12 (Goods/Service release)

- The Acceptor releases/hands over the goods/services to the Customer
